TABLE 5.7	TYPE OF TOILET USED BY THE HOUSEHOLD BY PROVINCE.....	151
TABLE 5.8	TYPE OF THE TOILET USED BY THE HOUSEHOLD- BY QUINTILES GROUP.....	152
TABLE 5.9	TYPE OF SANITATION SYSTEM USED- BY PROVINCE.....	153
TABLE 5.10	TYPE OF SANITATION SYSTEM USED- BY QUINTILES.....	154
TABLE 5.11	GARBAGE COLLECTION SYSTEM FOR THE HOUSEHOLD-BY PROVINCE.....	155

## PREFACE

Pakistan Social and Living Standards Measurement Survey (PSLM), 2013-14 is the ninth round of a series of surveys planned to be conducted up to June 2015. This survey currently covers 17989 households providing detailed outcome indicators on Education, Health, Population Welfare, Water Supply & Sanitation and Income & Expenditure. This report contains results on social indicators whereas Income & Expenditure report is being released separately.

The activities of the ninth round were carried out between August 2013 to June 2014. This report provides information on the key social indicators at National, as well as at Provincial levels with urban/ rural breakdown. It also provides a comparison with the last provincial rounds of PSLM Surveys 2011-12 and 2007-08.

This report contains five chapters, which includes Introduction, Education, Health, Population Welfare and Water Supply & Sanitation. Overall the trends of different indicator are in-line with previous results. However, there is a continuing declining trend in literacy and primary enrolment in some areas. In order to revalidate this declining trend in literacy and primary enrolment, 28 PSUs were identified and revisited under the supervision of officers of headquarter and Chief of concerned regional offices with other field teams. Results of the 28 areas which were re-enumerated confirm the previous results as reported in the main data of PSLM survey 2013-14. The major reasons identified were the devastating floods in 2010 which severely affected the infrastructure of schools. The previous PSLM rounds after 2010 have also shown consistent trends in primary enrolments. Further the district level survey of PSLM series also show similar trends. The other reasons in some cases are shortage of schools, teachers/student absenteeism and lack of interest at the level of parents, students and teachers, particularly in rural areas.

I would like to congratulate Mr. Ayazuddin, Deputy Director General PBS and the whole PSLM team for the successful completion of the task. The report is also available on the website of PBS.

Comments and suggestions to further improve the survey and this report in future are welcome.

(Asif Bajwa)  
Chief Statistician

Government of Pakistan  
Statistics Division  
Pakistan Bureau of Statistics  
Islamabad  
May, 2015

## ACKNOWLEDGEMENTS

Pakistan Social and Living Standards Measurement (PSLM) Survey was started in the year 2004 and are planned to be conducted up to 2015. It provides Social & Economic indicators in the alternate years at Provincial and District level. The PSLM Survey is a major contribution towards construction of database on Education, Health, Population Welfare and Water Supply & Sanitation. The data generated through surveys is being used to assist the government in formulating developments plans at National/provincial level and rapid assessment of programs initiated in the overall context of Millennium Development Goal's (MDGs).

This is fourth report of PSLM National/ Provincial level survey after PSLM 2005-06, 2007-08 & 2011-12 and provides information at National/ Provincial level with urban/ rural breakdown. This report contains the data collected from 17989 household based on 1307 urban & rural Primary sampling units (PSU's). Fieldwork of PSLM 2013-14 was started in August 2013 till June 2014.

The timely completion of the fourth round of the PSLM National/Provincial level report has been possible because of the enormous hard work and devotion put in by the PSLM management team at headquarters, the Data Processing Centre, PSLM field teams and Sample Design Section of the Pakistan Bureau of Statistics. It is indeed a matter of great pride for the whole organization.

Considering the requirements of the policy makers, planners, researchers and other data users, efforts have been made to improve the report. It is hoped that the data users will find this report useful and any further comments and suggestions for future improvement will be highly appreciated.

(Ayazuddin)  
Deputy Director General

Government of Pakistan  
Statistics Division  
Pakistan Bureau of Statistics  
Islamabad  
May, 2015

**List of Officers Involved In PSLM Survey 2013-14**

The PSLM report is produced by the efforts of the following officers/officials of Pakistan Bureau of Statistics listed under the specific tasks:

## EXECUTIVE SUMMARY

The report provides the National/Provincial findings of the Pakistan Social and Living Standards Measurement (PSLM) Survey 2013-14. During this round, 17,989 households were covered across urban and rural communities. Information was collected from households on a range of social sector issues. These are primarily focussed on the sectors covered under Poverty Reduction Strategy Paper (PRSP) and in the overall context of MDG's i.e. Education, Health, Population Welfare and Water supply & sanitation.

To study the behaviour and variation of main indicators between different groups, the information is disaggregated by province, region (urban-rural) and by gender. This report also provides information and comparison wherever possible from the earlier rounds of PSLM 2007-08 and 2011-12. Discussion on key findings in each sector between 2013-14 and 2011-12 is outlined below:

### Education

The Gross Enrolment Rate (GER) for primary schools (Age 5-9) is 90 percent in 2013-14 as compared to 91 percent in 2011-12. The Net Enrolment Rate (NER) is 57 percent in 2013-14, substantially lower than the Gross Enrolment Rate because of the enrolment of overage children in primary schools. The PSLM survey collects information on enrolment in all types of schools i.e. public, private and Deeni madaris. This PSLM survey round shows a slight decline in the share of primary enrolments that are in government schools. The overall share has declined to 60 percent in 2013-14 from 61 percent in 2011-12.

The GER (Age 10-12) for middle level has marginally decreased to 55 percent in 2013-14 from 56 percent in 2011-12, whereas the NER slightly decline to 21 percent in 2013-14 from 22 percent in 2011-12. However, as usual a large difference remains between urban and rural areas in middle level enrolment rates. The Matric Level (Age 13-14) GER is 58 percent and NER is 14 percent in PSLM 2013-14 compared to 60 percent and 13 percent respectively in 2011-12 . The proportion of

persons (10 years and above) who report that they are literate remain stagnant at 58 percent during 2011-12 and 2013-14.

Further the comparison of different GERs and NERs have been carried out using official age group brackets at Primary, Middle and Matric Levels. However, on users demand the tables have also been worked out using different age brackets i.e. age 6 – 10 years for primary, 11 – 13 years for middle and 14 – 15 years for Matric level.

### **Health**

In Health section, the PSLM report includes immunization, diarrhoea, infant mortality rate and the use of pre and post-natal services.

Two measures of immunization coverage are presented. Based on mother's recall, at least one immunization has increased to 99 percent in 2013-14 from 98 percent in 2011-12. The measure that includes mother's recall as well as record of full immunization given to 12 to 23 months children decreased to 76 percent in 2013-14 from 80 percent in 2011-12. Full immunization rates based only on health cards has increased to 58 percent in 2013-14 from 56 percent in 2011-12.

The proportion of children under five suffering from diarrhoea increase to 9 percent in 2013-14 from 8 percent in 2011-12. All provinces has shown decline except Sindh.

About 72 percent of mothers in 2013-14 had pre-natal consultations as compared to 68 percent in 2011-12 during their last pregnancy. Prenatal consultations were much more common in urban areas than in rural areas but there is also considerable improvement in rural areas. For prenatal consultations during their last pregnancy overall 62 percent women in 2013-14 consult Private Hospital/Clinic as compared to 58 percent in 2011-12.

Infant Mortality Rate (IMR) an indicator of deaths of children below one year of age has increased to 65 per thousand live births in 2013-14 as compared to 63 per

thousand live births in 2011-12. Percentage of women who had received at least one Tetanus Toxoid injection during their all pregnancies remains stagnant at 75 percent during the survey period 2011-12 and 2013-14.

### **Population Welfare**

Population Welfare indicators has shown improving trends, Knowledge of at least one contraceptive method is almost universal. Contraceptive use has increased to 32 percent in 2013-14 from 29 percent in 2011-12. The spouse/ relative/ friend are the major source of contraceptive methods. Pills with 99 percent remain the most commonly known method. The three most commonly cited reasons that women gave for not using family planning is that they “Wanted children” 33 percent followed by “others” 19 percent and “Pregnant” 15 percent.

TFR for the PSLM survey 2013-14 has been calculated considering an average of three years preceding the survey (2010-12) which shows the same trend i.e. 3.9 children per woman as if compared with PSLM Survey 2011-12 where an average of three years (2008-10) preceding the survey has taken however there are some variation in Age Specific Fertility Rates (ASFR).

### **Housing, Water Supply & Sanitation**

The chapter on Water Supply & Sanitation includes main source of drinking water, installation of water delivery system at the household level, type of toilet and type of sanitation system used by household.

Motor pump is observed as main source of drinking water in PSLM 2013-14. Motor Pump facility has increased to 32 percent in 2013-14 as compared to 30 percent in 2011-12. Provincial comparison shows that in Punjab Motor Pump facility has increased to 46 percent in 2013-14 from 42 percent in 2011-12. Sindh with 42 percent and Khyber Pakhtunkhwa with 31 percent use tap water as a main source of drinking water. In Sindh it is mainly due to urban areas where 73 percent of the population is

using tap water. However, in Balochistan the main source of drinking water is tap water with 32 percent in 2013-14 as compared to 38 percent in 2011-12.

Use of Flush toilet has increased to 74 percent in 2013-14 from 72 percent in 2011-12. Seventeen percent households have no toilet facility followed by 9 percent are using non-flush. Access to flush toilets remains low in rural areas 61 percent as compared to urban areas 98 percent. By comparing provinces Punjab with 81 percent is at the top whereas Balochistan with 39 percent is at the bottom.

PSLM INDICATORS USED FOR MONITORING OF MDG's

Indicator	1990-91 (Base line)	2004-05	2007-08	2008-09	2010-11	2011-12	2012-13	2013-14	MDG Target 2015
<b>Education</b>									
Net Primary Enrolment Ratio	46	52	55	57	56	57	57	57	100
Literacy Rate	35	53	56	57	58	58	60	58	88
Gender parity Index (GPI) for primary education	0.73	0.85	0.88	0.88	0.88	0.9	0.89	0.88	1.00
Gender parity Index (GPI) for secondary education	N.A	0.83	0.81	0.8	0.85	0.81	0.89	0.84	0.94
Youth Literacy GPI	0.51	0.68	0.78	0.77	0.79	0.81	0.82	0.80	1.00
<b>Health</b>									
Proportion of fully immunized children 12-23 months	75	77	73	78	81	80	82	76	>90
Proportion of under 1 year children immunized against measles	80	78	76	79	82	81	83	77	>90
Proportion of children under five who suffered from diarrhoea in the last 30 days	26	16	10	10	11	8	10	9	<10
Proportion of births attended by skilled birth attendants	18	48	40	41	43	49	55	58	>90
Proportion of women 15-49 years who had given birth during last 3 years and made at least one antenatal care consultation	15	50	56	53	62	68	69	72	100
<b>Water Supply and Sanitation</b>									
Proportion of population (urban and rural) with sustainable access to improve water source	53	66	66	65	60	59	57	55*	93
Proportion of population (urban and rural) with access to sanitation	30	54	66	63	66	72	71	74	90

\* Improved water source includes Tap water and Hand pump as per practice used for Millennium Development Goals Report Pakistan.

**Introduction**

---

**1. Introduction****1.1 The PRSP, the MDGs and the PSLM**

The PSLM Project is designed to provide Social & Economic indicators in the alternate years at provincial and district levels. The project was initiated in July 2004 and will continue up to June 2015. The data generated through surveys is used to assist the government in formulating the Poverty Reduction Strategy Paper (PRSP) as well as development plans at district level for the rapid assessment of program in the overall context of Millennium Development Goals (MDGs). As such this survey is one of the main mechanisms for monitoring MDGs indicators. It provides a set of representative, population-based estimates of social indicators and their progress under the PRSP and MDGs. For MDGs, UN has set 18 targets for 48 indicators for its member countries to achieve by 2015. Pakistan has committed to implement 16 targets and 37 indicators out of which 6 targets and 15 indicators are monitored through PSLM Surveys.

PSLM District level survey collects information on key Social indicators whereas through provincial level surveys (Social & HIES) collects information on social indicators as well as on Income and Consumption while in specific sections information is also collected about household size; the number of employed people and their employment status, main sources of income; consumption patterns; the level of savings; and the consumption of the major food items.

This report is for the period 2013-14 which contains Indicators on Demographic characteristics, Education, Health, Employment, Population Welfare and Water Supply & Sanitation are developed at National/Provincial. Whereas report for the HIES part for the same period will be prepared separately.

## Introduction

---

### 1.2 Sample Design of PSLM Survey 2013-14

#### Objectives:

The data generated through PSLM Survey will be used to assist the government in formulating the poverty reduction strategy in the overall context of MDGs. The indicators will be developed at National/overall Provincial level in the following sectors.

1. Education
2. Health
3. Water Supply & Sanitation.
4. Population Welfare
5. Income & Expenditure

#### Universe:

The universe of this survey consists of all urban and rural areas of all four provinces, AJK and Gilgit Baltistan. FATA and Military restricted areas have been excluded from the scope of the survey.

#### Sampling Frame:

Pakistan Bureau of statistics PBS has developed its own urban area frame. Each city/town is divided into enumeration blocks. Each enumeration block is comprised to 200-250 households on the average with well-defined boundaries and maps. The list of enumeration blocks as updated from field on the prescribed Proforma by Quick Count Technique in 2013 for urban and the list of villages/mouzas/dehs or its part (block), updated during House listing in 2011 for conduct of Population Census, are taken as sampling frame. Enumeration blocks and villages are considered as Primary Sampling Units (PSUs) for urban and rural domains respectively. A project to update the rural blocks is currently in hand.

**Introduction**

The numbers of enumeration blocks in urban and mouzas/dehs/villages in rural areas of the country are as under:

**NO. OF ENUMERATION BLOCKS AND VILLAGES AS PER SAMPLING FRAME 2014**

PROVINCE	NO. OF BLOCKS	
	URBAN	RURAL
Punjab	22415	58063
Sindh	20737	16946
KP	2886	16247
Balochistan	1519	8159
FATA	-	3756
Islamabad	590	500
Azad Jammu & Kashmir(AJK)	404	3601
Gilgit Baltistan(GB)	146	1086
<b>Total</b>	<b>48697</b>	<b>108358</b>

**Stratification Plan**

**Urban Areas:**

Large sized cities having population five laces and above have been treated as independent stratum. Each of these cities has further been sub-stratified into low, middle and high income groups. The remaining cities/towns within each defunct administrative division have been grouped together to constitute an independent stratum.

**Rural Areas:**

The entire rural domain of a district for Khyber Pakhtunkhwa, Punjab, and Sindh provinces has been considered as independent stratum, whereas in Balochistan province defunct administrative division has been treated as stratum.

**Sample Size and its Allocation:**

To determine optimum sample size for this survey, 6 indicators namely Literacy rate, Net enrolment rate at primary level, Population 10+ that ever attended school, Contraceptive prevalence of women age 15-49 years, Children age 12-23 months who are fully immunized and post natal consultation for

A sample size of 1368 PSUs (19620 households) was selected from all four provinces of Pakistan.

**Introduction**

ever married women aged 15-49 years were taken into consideration. Keeping in view the prevalence of these indicators at different margin of errors, reliability of estimates and field resources available a sample of size 19620 households distributed over 1368 PSUs (567 urban and 801 rural) has been considered sufficient to produce reliable estimates in respect of all four provinces with urban rural breakdown, however data was collected from 1307 PSU'S by covering 17989 household.

The distribution plan of PSUs and SSUs by province and region is as under:

**PROFILE OF THE PSLM NATIONAL / PROVINCIAL LEVEL SURVEY 2013-14**

Balochistan	564	2064	2628	409	1250	1659
<b>Total</b>	<b>6804</b>	<b>12816</b>	<b>19620</b>	<b>6234</b>	<b>11755</b>	<b>17989</b>
AJK	480	672	1152	422	624	1046
Gilgit Baltistan(GB)	384	656	1040	350	619	969
<b>Total</b>	<b>864</b>	<b>1328</b>	<b>2192</b>	<b>772</b>	<b>1243</b>	<b>2015</b>
<b>Grand Total</b>	<b>7668</b>	<b>14144</b>	<b>21812</b>	<b>7006</b>	<b>12998</b>	<b>20004</b>

**Note:** Out of 1368 PSUs, of all four provinces 61 PSUs (11 urban and 50 rural PSUs) of Balochistan were dropped due to bad law and order situation and the remaining 1307 PSUs (556 urban and 751 rural) comprising 17989 households were covered. However results for the AJK and G.B are not given in the report.

**Sample Design:**

A two-stage stratified sample design has been adopted for this survey.

**Selection of primary sampling Units (PSUs):**

Enumeration blocks in urban and rural domains have been taken as PSUs. In urban and rural domains sample PSUs from each stratum have been selected by PPS method of sampling scheme; using households in each block as Measure of size (MOS).

**Selection of Secondary Sampling Units (SSUs):**

Households within PSU have been considered as SSUs. 16 and 12 households have been selected from urban/rural domains respectively by systematic sampling scheme with a random start.

**Introduction**

---

**1.3 Household and Survey Questionnaire**

At both individual and household level, the PSLM Survey collects information on a wide range of topics using an integrated questionnaire. The questionnaire comprises a number of different sections, each of which looks at a particular aspect of household behaviour or welfare. Data collected under Round IX includes education, diarrhoea, immunization, reproductive health, pregnancy history, maternity history, family planning, pre and post-natal care and access to basic services.

**1.4 Objectives and Scope of Analysis**

This is the ninth round report of the PSLM surveys conducted between 2004-2015. The PSLM is a large, complex household survey that collects information on a number of different sections. The tabulations presented in this report comprise the tables at National/ Provincial level with urban /rural breakdown and detailed analytical comparison has been carried out with previous rounds of PSLM. Some of the tables have been also presented based on consumption quintiles. The methodology of computing quintiles based on consumption is explained in Appendix-A, Technical Notes Part C.

**1.5 Data Quality and Reliability Measures**

Data quality in PSLM Survey has been ensured through a built in system of checking of field work by the supervisors in the field and by the in charge of the concerned Regional/Field offices. Teams from the headquarters also pay surprise visits and randomly check the work done by the enumerators. Regional/ Field offices ensured the data quality through preliminary editing at their office level. The entire data entry was carried at the PBS headquarter Islamabad and specially designed data entry programme had a number of built in consistency checks. To determine the reliability of the estimates confidence interval and Standard error of important key indicators have been worked out and are attached at the end of each section.

## Education

---

### 2. EDUCATION

#### 2.1 Introduction

Education plays an important and pivotal role in development of a nation by bringing social development, economic prosperity and human resource development. The Government assigns a very high priority to developing a high quality, equitable and widely accessible education system in Pakistan. It is need of the hour to have such a mechanism to facilitate different levels of management of the education sector to achieve the desired goals.

Basic infrastructure and multiple systems of education are the major hurdles in imparting quality education. Scarcity of resources, provision of adequate facilities and training are retarding the proper growth of educational system in Pakistan. As it is enhanced in the PRSP for the education sector, it includes improving the functioning & utilisation of existing schools, improving the quality of education, increasing enrolment, improving access to education and expanding the primary education system. In fact education introduces and prepares to cope with the new orders of the modern age.

As per national educational policy. “Our education system must provide quality education to our children and youth to enable them to realize their individual potential and contribute in the development of society & nation, creating a sense of Pakistani nationhood, tolerance, social justice, democracy, regional and local culture and history based on the basic ideology enunciated in the Constitution of the Islamic Republic of Pakistan<sup>1</sup>.”

*Article 25A of the Constitution of Pakistan makes it a justiciable right, obligating the state to provide free and compulsory education to the children of age five to sixteen years.*

Under the 18<sup>th</sup> Amendment, Ministry of Education has been devolved and has become a provincial subject. The purpose of 18<sup>th</sup> amendment is to give autonomy to provinces so that they can manage the resources as well as plan according to their respective situation. For this purpose, changes have been made in key areas of

---

<sup>1</sup> National Education Policy 2009[p-17]

## Education

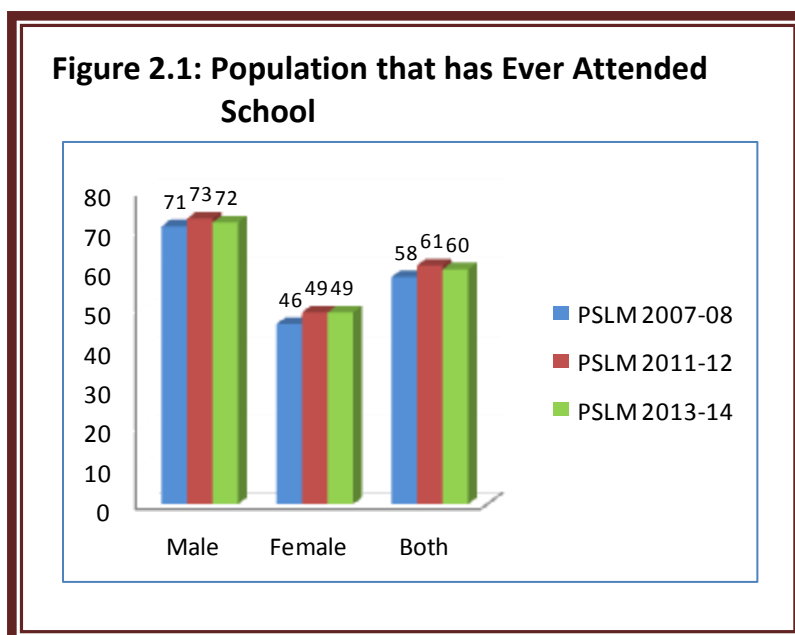

education sector, however Planning, Policy and Standards of education beyond Grade 12, covered under Federal Legislative List<sup>2</sup>.

PSLM data on Education is a good source to monitor the progress in education sector, it produces variety of key indicators for all provinces by Urban/Rural breakdown and is also one of the major source for monitoring MDG's, two indicators "Net primary enrolment" and "Literacy rate" under goal 2 "Achieve Universal Primary Education" and two indicators "Gender parity index" for primary and secondary education and "Youth literacy GPI" under goal 3 "Promote Gender Equality and Women Empowerment".

This chapter will mainly cover indicators on school attendance, Gross and Net enrolment rates, and expenditure on education, early leavers and children not attending school, literacy etc.

### 2.2 School Attendance

More than one half of the population of ten years and older i.e. 60 percent in 2013-14 as compared to 61 percent in 2011-12 has ever attended school (Table 2.1). This proportion is higher in urban areas than in rural areas i.e. 75 percent and 51 percent respectively, this is much higher in men than in women i.e. 72 percent and 49 percent respectively. No significant change has been observed due to smaller gap between the two PSLM surveys regarding different age groups. The Proportion is high in early age groups 10-14 i.e. 79 percent and low in later age groups 60+ i.e. 26 percent. Table 2.2

<sup>2</sup> Eighteenth Amendment: Federal and Provincial Roles and Responsibilities in Education

## Education

The school attendance increases with the increase in quintiles for overall Pakistan and by province. In the highest 5<sup>th</sup> quintile, 82 percent female of urban areas and 61 percent of rural areas have ever attended school as compared to 40 percent of urban and 20 percent of rural females in the lowest 1<sup>st</sup> quintile. Regarding males all the four provinces have shown the similar increasing trend from first to fifth quintile. Table 2.3

The proportion of the population 10 years and older that has completed primary level or higher education is 49 percent in 2013-14 as compared to 50 percent in 2011-12, which shows slight decline but is not statistically significant. The proportion is highest in Punjab with 53 percent and lowest in Balochistan with 33 percent. Table 2.4

### 2.3 Primary Enrolment Rate

The Gross Enrolment Rate (GER), is also referred to the participation rate, defined as the number of children attending primary school divided by the number of children with the specific age group who ought to be attending school. The GERs are presented in this report in two different ways; excluding and including katchi class by two different age groups.

The GER at primary level (excluding katchi) is 90 percent for age 5-9 years and 91 percent for age 6-10 years in 2013-14 as compared to 91 percent and 92 percent respectively

in 2011-12. Females has a lower enrolment rate than males in all four provinces both in urban and rural areas, the difference between both sexes is also markedly larger in rural areas than in urban areas. Punjab has the highest enrolment rate for both age groups (5-9 years & 6-10 years) among all four provinces. Table 2.6a and 2.6b

**Education**

The overall GER at primary level including katchi class is 90 percent in 2013-14 as compared to 91 percent in 2011-12. Punjab has highest GER as compared to other provinces, for males with 109 percent and females with 97 percent, while Balochistan has the lowest GER i.e. 74 percent and 46 percent for males and females respectively. It is worth mentioning here that GER in Sindh urban has declined substantially to 95 percent in 2013-14 from 103 percent in 2011-12. Table 2.7

The Net Enrolment Rate (NER) at primary level refers to the number of students enrolled in primary school of required primary school age divided by the number of children in the same age group for that level of education. For Pakistan, the primary NER is the number of children aged 5 to 9 years attending primary level divided by the number of children aged 5 to 9 years.

The NER at primary level (excluding katchi) is 57 percent for age 5-9 years and 65 percent for age 6-10 years in 2013-14 as compared to 57 percent and 68 percent respectively in 2011-12. There are marginal variations in all four provinces as compared to 2011-12. NER

is highest in Punjab with 64 percent and lowest in Balochistan with 39 percent. Girls have a lower NER than boys in all four provinces and both in urban and rural areas, where difference between both sexes is markedly larger in rural areas than in urban areas. Sex differences are largest in rural Khyber Pakhtunkhwa and Balochistan. Tables 2.9a and

**Figure 2.3: NER Primary Age (5-9) Excluding Katchi**

2.9b. When katchi class is included, the NER at Primary level has declined to 62 percent in 2013-14 as compared to 64 percent in 2011-12. Table 2.10

Education

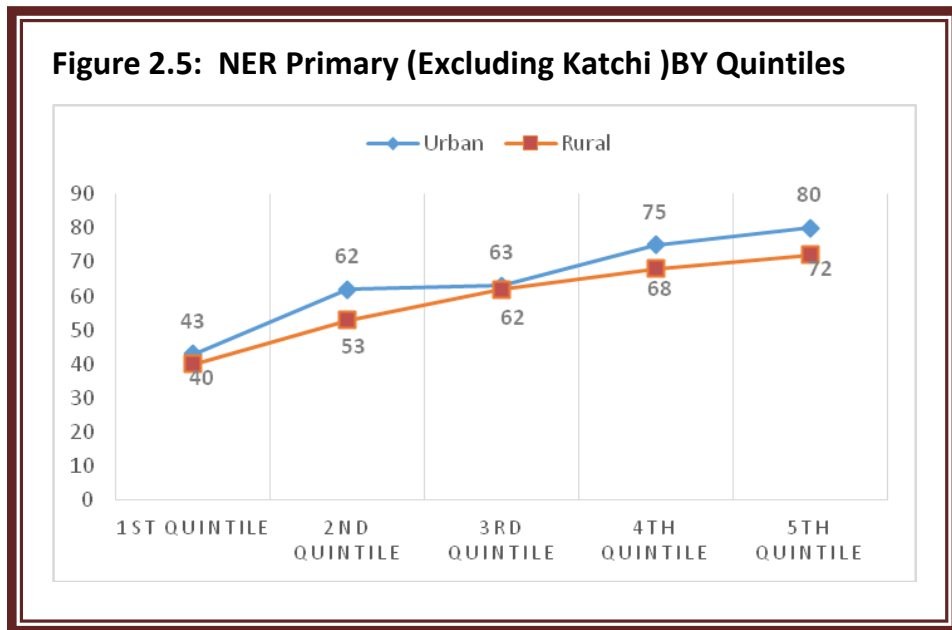

The reason for the large difference between the GER and the NER is the significant number of over-age children who attend primary school. Table 2.12 gives a good picture of this situation, where only 55 percent of 5 year old boys attend primary school, there are significant numbers of overage children i.e. age 11 year (62 percent), 12 years (36 percent) and 13 years (20 percent) who are still in Primary schools. At every age, a higher percentage of girls than boys are not attending school.

Another way of looking at female enrolment at primary level is to express it as a percentage of total primary level enrolment; (both male and female). When katchi class enrolment is excluded, this measure has been decreased to 43 percent in 2013-14 from 45 percent in 2011-12, this decline is mainly due to decline in girl’s enrolment in Sindh, similarly this measure has marginally decline to 44 percent in 2013-14 from 45 percent in 2011-12, when katchi class enrolment is included. Table 2.13

**Education**

In Tables 2.14, 2.15 and 2.16, the GER and NER have been estimated quintile-wise. They show a strong positive relationship between household consumption and

primary enrolment in both urban and rural areas i.e. enrolment is higher in the highest quintiles compared to lower quintiles. The gap between male and female enrolment is higher in lower quintiles mainly in rural areas as compared to urban areas in all four provinces of Pakistan.

**2.4 Enrolment in Government Schools**

The PSLM Survey 2013-14 collects information on enrolment in all types of schools, not just in the government schools. Table 2.8 shows the gross enrolment rate in government primary schools excluding katchi class. It is calculated as the number of children enrolled in government primary schools divided by the number of children of primary school age (5-9). One of the

main strategies of the Government of Pakistan is to expand public provision of primary

**Education**

---

education and this can be assessed if government schools have increased their coverage of the population, by increasing enrolments faster than the growth in population. However, PSLM Survey shows marginal decline in this measure over the period, the coverage of the public school system has slightly decreased to 54 percent in 2013-14 from 56 percent in 2011-12. Here again the decline is mainly due to decline in enrolment in Government Schools in Sindh rural, where it has declined to 52 percent in 2013-14 from 59 percent in 2011-12.

Table 2.11 shows the NER for government primary schools. This is the number of children aged 5-9 years enrolled in government primary schools divided by the total number of children aged 5-9. Like the gross enrolment rate for government schools, it measures the extent to which publicly provided education is reaching to its target group excluding overage children who are enrolled in primary school. The NER at primary level for Government Schools remains stagnant at 33 percent during the period of 2011-12 and 2013-14.

The percentage of primary school students who are enrolled in government schools is shown in Table 2.17. The government share of primary enrolment has marginally declined, to 60 percent in 2013-14 from 61 percent in 2011-12 percent though it is not statistically insignificant, when katchi is excluded. The similar pattern is observed for the percentage of primary school students who are enrolled in government schools when katchi is included i.e. 58 percent in 2013-14 as compared to 59 percent in 2011-12.

As per general perception, the better-off households are more likely to send their children to private primary schools. Table 2.18 shows that the percentage of school children enrolled in government schools falls as income rises in both urban and rural areas, except in rural Balochistan where even in highest quintiles 78 percent of the total enrolment is still in government schools for both sexes. However, in urban Punjab and Sindh, even a considerable proportion of the poor manage to send their children outside to the private primary sectors. The quintile base analysis shows that the percentage of primary class students in private schools rises with increase in income.

**Education**

Enrolment in Government Schools has decreased to 59 percent in 2013-14 from 61 percent in 2011-12. The pattern is same at Primary and Middle level. Private enrolment overall has slightly increased to 37 percent in 2013-14 from 36 percent in 2011-12. Table 2.20

**2.5 Expenditure on Education**

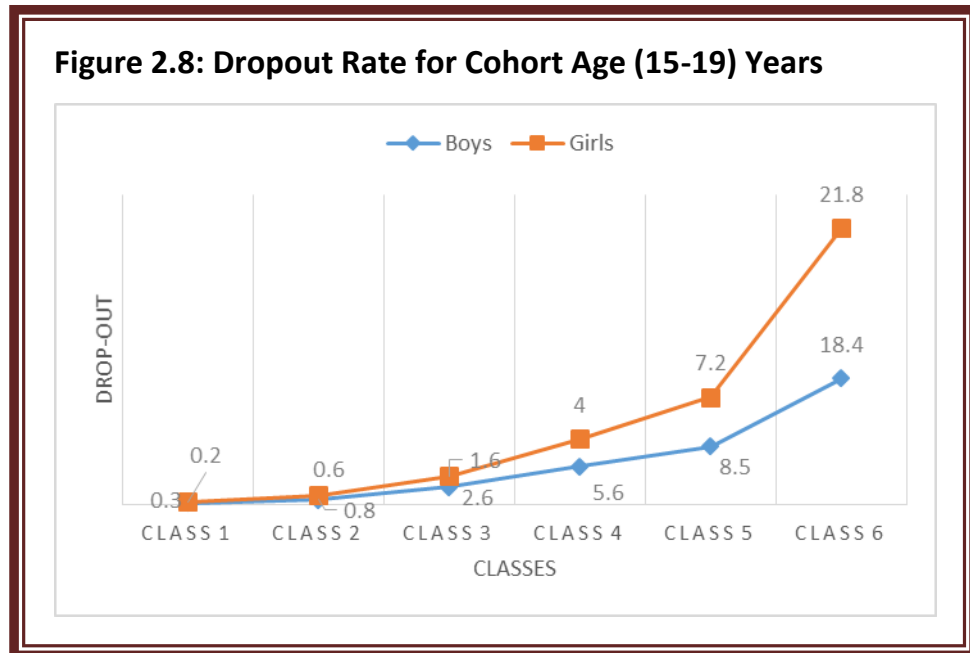

Household’s average expenditure on a single primary school student is Rupees 6290 per year. Urban households spend more i.e. Rupees 15113 per year than rural households with Rupees 7197 per year on each primary school student. For students attending private primary schools the expenditure on average is, more than three times i.e. Rupees 16938 as much as compared to those attending government primary schools i.e. Rupees 5761. The average expenditure on education is greater in urban areas as compared to rural areas at all levels of education both in government school and in private schools. However, difference in the average expenditure between urban and rural areas is greater in private schools as compared to government schools. Table 2.21

**2.6 Early Leavers and Non-Attendance**

Leaving schools before completing the primary level education has been a problem in Pakistan. Percentage of students in the age group 10-18 years who have attended primary school at some point in the past and left before completing primary, remains stable at 8 percent in 2013-14 and 2011-12. Table 2.22

Education

Regarding drop-outs of children by Gender and Class shows a similar measure for children aged 15-19. In this table, the percentage of children that left before completing each class has been calculated, for children who have been to primary school at some

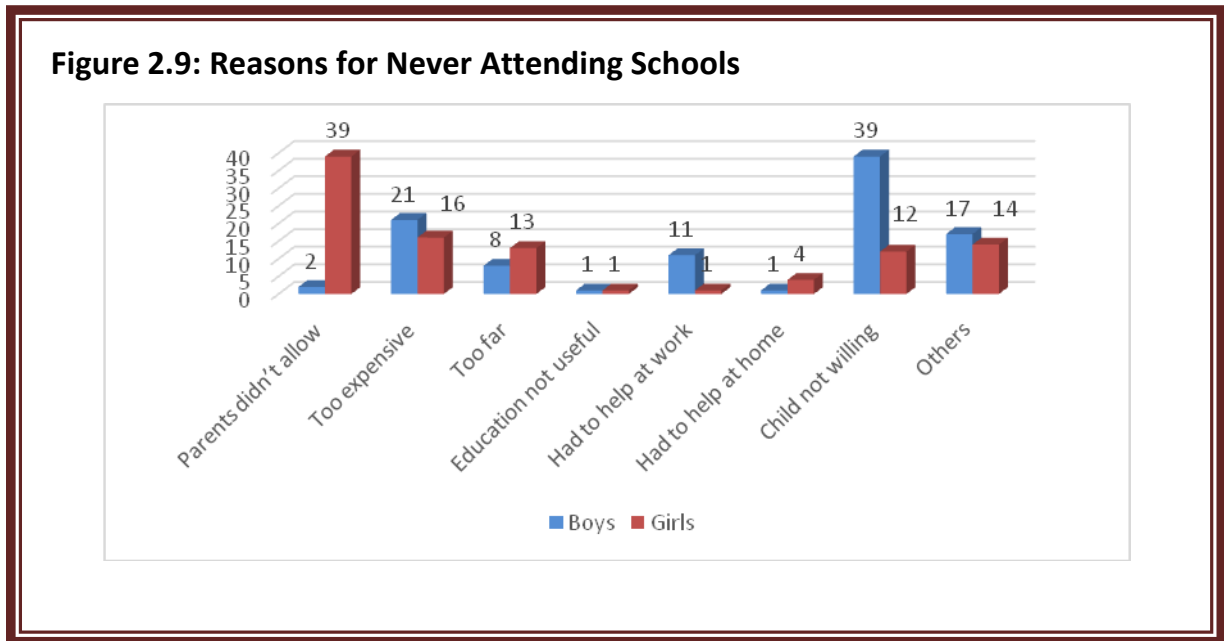

point in the past. It is easier to interpret this measure because it will exclude fewer over-age children who are still enrolled in primary school, as it covers 15-19 year old children instead of 10-18 year olds. It shows that, overall, about 7.7 percent of children in 2013-14, who have enrolled in primary school drop out before completing primary (class 5). However, the largest drop out is at the end of primary, with 19.8 percent dropping out before reaching the end of class 6. Once enrolled, boys and girls have similar drop-out rates up to the end of primary, although girls are less likely to make the transition to middle school, particularly in rural areas. Most of the drop outs will be children failing to make the transition from primary to middle school. Table 2.23

Parents often explained their child’s drop out from school as the “Child not willing”. This was cited as the main reason for 56 percent of boys and 33 percent of girls. Other common explanations were reported as “Too expensive”, both in urban and rural areas especially in case of boys with 19 percent and 13 percent respectively. For girls, “Parents did not allow”, is the second most cited reason for leaving school in urban areas as well as rural areas. Table 2.24

**Education**

Reasons for never attending school vary between girls and boys. For boys, “Child not willing” i.e. 39 percent is most cited reason which is obviously not a convincing reason as a child cannot make decisions for himself. For girls, the leading reason is “Parents did not allow” i.e. 39 percent. For both boys and girls, the cost of education is the second most cited reason for never attending school. Table 2.25

**2.7 Literacy**

Literacy is an important indicator of education because its improvement is likely to have an impact, on other important indicators of welfare. The literacy rate for population 10 years and above remains stagnant at 58 percent

during 2011-12 and 2013-14. Literacy remains much higher in urban areas than in rural areas i.e. 74 percent and 49 percent respectively and much higher in men than women i.e. 70 percent and 47 percent respectively. Table 2.26 There is a strong association between literacy

**Education**

and age, with younger cohorts having much higher literacy levels. This pattern has been observed both in urban and rural areas. Table 2.27 Literacy is strongly associated with household income. 53 percent of males with lowest income group are literate as compared to 93 percent in the highest income group in urban areas. Only 17 percent of women in rural areas are literate in the lowest quintile as compared to 37 percent in lowest quintile in urban areas, 59 percent women in rural areas and 81 percent women in urban areas are literate in highest quintile, and on the whole the situation is poor for females in rural Sindh and Balochistan wherein lowest quintile it is 13 percent and 11 percent respectively. Table 2.28

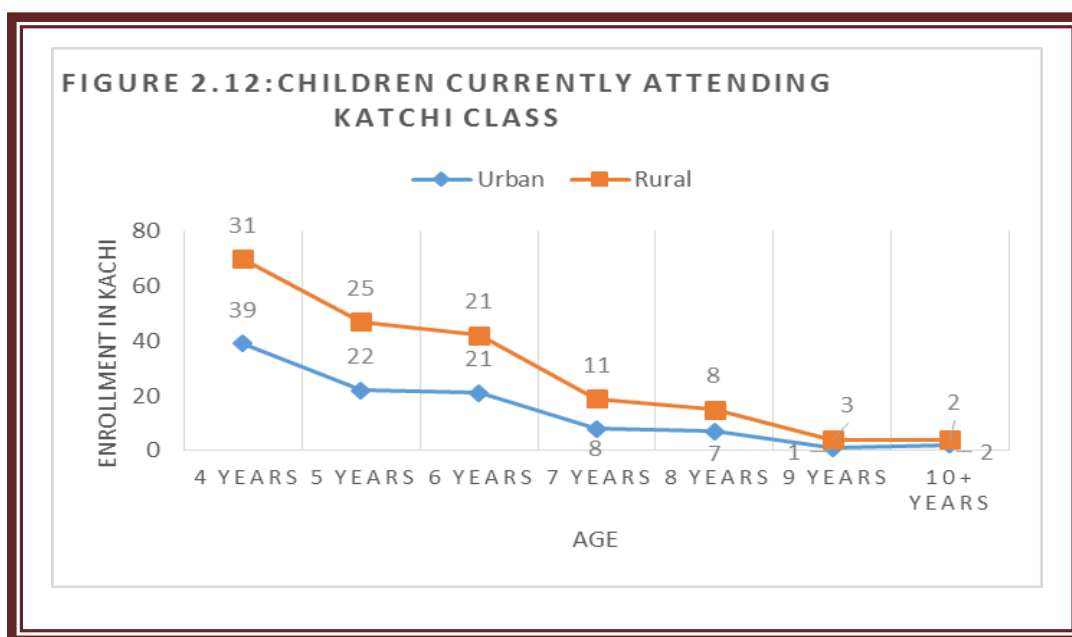

**2.8 Katchi Class**

Although katchi class is intended for four to five year old but higher age children are also enrolled in this class. Children enrolled in katchi aged 6 years and older are (42 per cent), and four year old make up 33 percent of katchi enrolments in 2013-14. Table 2.29

Late entry to katchi is more a feature of rural areas than urban areas. Punjab (19 percent) have the highest proportion of students enrolled in katchi class followed by 15 percent in Khyber Pakhtunkhwa, 13 percent and in Sindh and only 8 percent in Balochistan. Table 2.30b

Education

2.9 Middle and Matric Enrolment Rates

GER and NER for the middle level are presented in Tables 2.31a and 2.32a. These rates are calculated for the 10-12 year old. The GER for the middle level, for Pakistan as a whole, is 55 percent in 2013-14 as compared to 56 percent in 2011-12. Female gross enrolment rate remains stable at 50 percent and male gross enrolment rates have marginally declined to 60 percent in 2013-14 from 62 percent in 2011-12. There is a large gap in GER between urban areas and rural areas, which are 69 and 47 percent respectively in 2013-14. Tables 2.31b and 2.32b have been added for GER & NER for middle level by changing age groups from 10-12 years to 11-13 years, however, changing age group also follows the same trend.

NER at the middle level are much lower than GER. Table 2.32a The NER slightly decline to 21 percent in 2013-14 from 22 percent in 2011-12. In rural areas, there is slight decrease to 18 percent in 2013-14 from 19 percent in 2011-

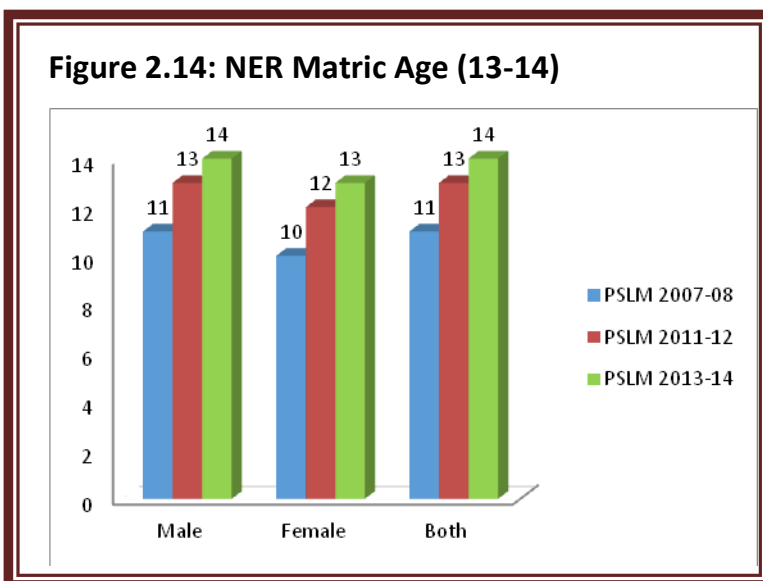

**Education**

12, however the NER for males in urban Khyber Pakhtunkhwa has increased to 30 percent in 2013-14 as compare to 25 percent in 2011-12. Positive relationship has been observed between the level of income and GER and NER at the middle level i.e. lower quintiles have lower enrolment rates as compared to higher quintiles. The similar pattern is observed in all the four provinces and also in urban and rural areas.

However, female gross enrolment rates for poor households in rural areas are very low particularly in Sindh and Balochistan province which is 7 percent for both provinces. Table 2.33. NER is also low in lower quintiles as compared to higher quintiles in both urban and rural areas which is 16 percent and 10 percent respectively. Table 2.34

GER at matric level shows a marginal decline to 58 percent in 2013-14 from 60 percent in 2011-12, GER in rural areas for females are significantly lower with 35 percent than GER for females at urban areas with 72 percent, similarly NER at the matric level has increased to 14 percent in 2013-14 from 13 percent in 2011-12 for age group 13-14 years. Tables 2.35a and 2.36a. The gap between boys and girls enrolment in rural areas is even wider at this level. Tables 2.35b and 2.36b have been added for

GER & NER respectively for Matric level by changing age group from 13-14 to 14-15. However, it follows the same trend for both age groups.

NER at Matric level is 5 percent in lowest quintile in rural areas against the 23 percent in the highest quintile, similarly in urban areas 3 percent in lowest quintile and 33 percent in highest quintile, which shows the strong relationship between enrolment and household income. Table 2.38

## Education

---

### 2.10 Gender Parity Index

One of the major goals of MDGs is to “Promote gender equality and women empowerment” which is measured through indicator like Gender parity index (GPI) for enrolments and for youth literacy. Ratio near 1 means that disparities between males and females have decreased. For the convenience of data users and for monitoring of MDG’s these indicators are also tabulated by PSLM survey. GPI usually designed to measure the relative access to education of males and females. The GPI at primary or secondary is defined as net enrolment rate of females at primary or secondary level divided by net enrolment rate of males in primary or secondary level. The GPI in primary education is 0.88 in 2013-14 as compared to 0.90 percent in 2011-12 and the GPI at secondary education is 0.84 percent in 2013-14 as compared to 0.81 percent in 2011-12. Similarly, youth literacy GPI is defined as females who are 15-24 years old and literate divided by total number of males 15-24 years old. In Youth literacy, GPI is 0.80 in 2013-14 as compared to 0.81 in 2011-12. Table 2.39

NOTES:

1. Gross enrolment rate: [Number of children attending primary level (classes 0-5) divided by number of children aged 4 - 9 years] multiplied by 100. Enrolment in Katchi is included.
2. Numerator of GER: Raised sum of all individuals who report currently attending primary level.
3. Denominator of GER: Raised sum of all individuals aged 4- 9 years who respond to the relevant questions.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

NOTES:

1. Quintiles: Quintiles are based on per capita consumption expenditure of 17,989 households.
2. The 1st quintile contains individuals with the lowest consumption level, whereas the 5th quintile contains individuals with the highest consumption level.
3. Gross enrolment rate: (Number of children attending primary level (i.e. class 1 - 5) divided by number of children aged 5 - 9 years) multiplied by 100.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

## NOTES:

1. Quintiles: Quintiles are based on per capita consumption expenditure of 17,989 households
2. The 1st quintile contains individuals with the lowest consumption level, whereas the 5th quintile contains individuals with the highest consumption level.
3. Children attending primary level in a private school expressed as a percentage of all children attending primary level in the quintile indicated. Only private, for-profit schools are included in this measure; children enrolled in NGO schools, Deeni Madrissa and other non-government schools are excluded from the numerator. Enrolment in Katchi class is included.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

KP	8	16	11	5	12	8	4	12	7
BALUCHISTAN	8	14	10	7	12	9	8	11	9

NOTES:

1. Children aged 10 -18 years that left school before completing primary level, expressed as a percentage of all children aged 10-18 years that have attended school in the past, or are currently attending school, but excluding those children currently attending school that are presently enrolled in Class 5 or lower. Enrolment in Katchi is excluded.
2. Percentage of children left school: Numerator is the total number of individuals aged 10-18 years who attended school, but left before completing primary level. The denominator is the numerator + total number of individuals aged 10-18 years who completed class 5 or higher, or who are currently attending class 6 or higher.
3. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Baluchistan province could not be covered due to security reasons, so the results of Baluchistan province may be read with caution.

NOTES:

1. The cohort is children 15 – 19 years old that have ever attended primary school. Taking this cohort to be 100 percent, the table shows the percentage of this cohort who dropped out of school before completing each class indicated. Those children in this cohort that are still attending school but have not completed primary school as yet have been excluded from this table. The measure is cumulative, that is, for each class it shows the proportion that dropped out in that class or in a class below.
2. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

NOTES:

- 1 Gross enrolment rate: [Number of children attending middle level (classes 6 - 8) divided by number of children aged 10 - 12 years] multiplied by 100.
- 2 Numerator of GER: Raised sum of all individuals who report currently attending middle level (class 6 - 8).
4. Denominator of GER: Raised sum of all individuals aged 10 - 12 years who respond to the relevant questions.
5. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

**Health**

---

**3. HEALTH****3.1 Introduction**

A good health system delivers quality services to all people, when and where they need them. The exact configuration of services varies from country to country, but in all cases requires a robust financing mechanism; a well-trained and adequately paid workforce; reliable information on which to base decisions and policies; well maintained facilities and logistics to deliver quality medicines and technologies<sup>3</sup>. The World Health Organization (WHO) defined health in its broader sense in 1946 as "a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity."

The Ministry of National Health Services Regulation and Coordination is a government agency responsible for Pakistan's health system. The Ministry of health was devolved to the provinces under the 18<sup>th</sup> Amendment. Besides the federal health department, each of the four provinces of Pakistan has its respective health department and Secretariat, headed by the health minister. Respective Ministries stand responsible to control, manage, administer medical service matters frame and enforce health policies in their respective provinces in line with that promulgated by the federal health department.<sup>4</sup>

The following programs have been transferred to provincial health departments

- National Programme for Family Planning & Primary Health Care,
- Polio Eradication Program,
- National Maternal, Neonatal and Child Health (MNCH) Program, Expanded Program on Immunization and
- National Program for Prevention and Control of Hepatitis.

PSLM survey data on Health is a good source to monitor the progress in Health sector with detailed comparison between the data results before and after the implementation of devolution plan. Pakistan Bureau of Statistics through PSLM survey

<sup>4</sup> Ministry of Health (Pakistan) /WHO apprehensive about Health Ministry's devolution.

**Health**

---

produces key indicators on Health both at National/Provincial and District level. Indeed it is a good source for the Federal government & for provinces to overview the progress and to assess the areas where serious and comprehensive efforts are required.

**This section presents indicators on:**

- Infant mortality rate.
- Proportion of fully immunised children.
- Proportion of children under five who suffered from diarrhoea in last 30 days and received ORS.
- Pre and Post Natal consultation.
- Person/Facility Consulted for Pre and Post Natal Consultation.
- Pregnant Women That Have Received Tetanus Toxoid Injection.
- Birth location and Person that Assisted with Delivery.

**3.2 Immunization**

IMMUNIZATION is a method of making a person immune to disease by injecting certain substances into the body, which stimulate the production of disease-fighting antibodies. Immunization is one of the most successful and cost effective health interventions. It has eradicated small pox, lowered the global incidence of polio and achieved dramatic reductions in illness, disability and death from diphtheria, tetanus, pertussis (whooping cough) and measles. It is a world-wide Programme being carried out in all countries assisted by WHO, UNICEF and other donor agencies. The world health organization suggests that a child must receive a dose of BCG vaccination in order to get protected against tuberculosis, three doses of DPT to have protection against diphtheria, pertussis, and tetanus, three doses of polio vaccine, and a measles vaccination.

In the past, immunization for children comprises a series of vaccinations e.g., BCG (anti-TB); DPT (anti-diphtheria/ pertussis /tetanus), anti-polio (drops), given by mouth not by injection and Measles. A few years back, government has also introduced COMBO (1, 2, 3), combination of DPT and Hepatitis. But from 2010 onwards BCG (anti-TB); PENTA (Diphtheria, Pertussis, Tetanus, Hemophilus Influenza B and Hepatitis B); anti-polio (drops);

**Health**

Measles 1 & Measles 2 are given as mentioned in table on immunization schedule. Measles 2 is additional vaccination given at the age of 15 months. These all are administered at specific intervals as given below:

**IMMUNIZATION SCHEDULE**

<b>Age of Child</b>	<b>Previous Schedule</b>	<b>New Schedule</b>
At birth	BCG (anti-TB); Polio drops	BCG (anti-TB) + Polio 0
6-weeks	DPT-I; Polio drops; Hepatitis.B-I	Pentavalent + Polio 1
10 weeks	DPT-II; Polio drops; Hepatitis.B-II	Pentavalent + Polio 2
14 weeks	DPT-III; Polio drops; Hepatitis.B-III	Pentavalent + Polio 3
9 months	anti-measles vaccine	Measles
12-15 months		Measles 2

To measure the accurate data on immunization the main problem is lack of the children’s immunization/health cards with full information on inoculations received. Through this survey we measure immunization on both “record” and “recall” basis. Immunization rates based only on the information available on immunization cards are called ‘Record’ based immunization, which may underestimate the coverage; however, it has the benefit of using written information recorded by health workers. The alternative is to ask parents about their child’s vaccination history on the basis of their memory, and to calculate coverage rates using this information is called ‘Recall’ based immunization. The information collected on the recall may create confusion because some time parents may not properly report the number and type of vaccination. However, enumerators are trained to probe and clarify the different types of immunization with their time duration to the respondents to have reliable information as much as possible; still the recall measure can’t refer as an ideal one. In this report, both of these measures are calculated for all children of the age range 12 to 23 month in the denominator.

Health care programs are designed to enhance the quality of life and facilitate the citizens to meet their health care needs.

Health

Table 3.1 presents immunization rates for children aged 12-23 months, who have been immunised during the period 12 to 23 months prior to the survey.

The record based immunization has increased to 58 percent in 2013-14 from 56 percent in 2011-12. The increase is more visible in urban areas i.e. 70 percent in 2013-14 from 67 percent 2011-12 as compared to rural areas with 53 percent in 2013-14 from 51 percent in 2011-12. By including the recall measures, the immunization rates (All 11 recommended vaccines), has shown decline to

76 percent in 2013-14 from 80 percent in 2011-12. The Sindh province lags behind particularly in rural areas. The decline in recall base immunization may refer to changes in questionnaires regarding new schemes of vaccination as mentioned earlier.

**Figure 3.1:-Children Aged 12-23 Months Fully Immunized – (Based on Record)**

Tables 3.2 (Record Based) and 3.3 (Recall and Record Based) presents the coverage by antigen. A visible increase in every antigen can be seen in, Tables

**Figure 3.2:- Coverage of Immunization by Antigen Record Based**

3.2 (record based), urban Khyber Pakhtunkhwa has shown highest coverage almost around 80 percent by every antigen except measles which is 76 percent.

Health

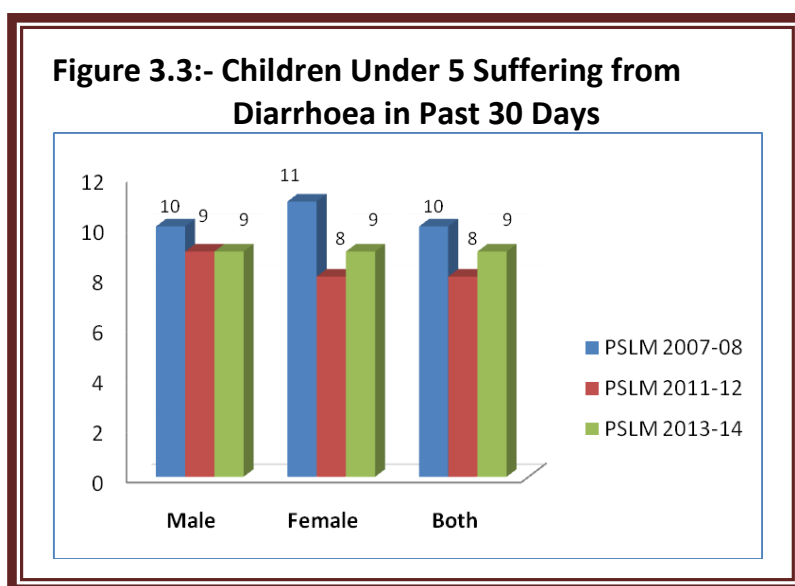

Table 3.3 is calculated for both record and recall measures shows decline in urban as well as rural areas. It is noticeable that, Sindh rural shown decline in almost every antigen except polio. The coverage of Measles in Sindh urban has declined to 77 percent in 2013-14 from 91 percent in 2011-12; similarly the coverage of measles has also declined in Sindh rural to 49 percent in 2013-14 from 57 percent in 2011-12.

3.3 Diarrhoea

Diarrhoea usually occurs when fluid cannot be absorbed from the content of your bowel, or when extra fluid is secreted into bowel, causing watery poo. Diarrhoea among children under 5 years of age is the serious health concern in Pakistan. One of the major factors that contribute to children mortality is the Dehydration caused by Diarrhoea. The prevention of Diarrhoea is one the primary goals of government both through improved water and sanitation and the treatment of dehydration through oral re-hydration salts (ORS). The death risk due to Diarrhoea can also be reduced by domestically prepared Oral Re-Hydration Salts (ORS) or a Recommended Home Fluid (RHF). Diarrhoea caused Dehydration can be effectively reduced by intake of more fluids.

Mothers were asked to report whether a child under five years of age had diarrhoea in 30 days prior to the survey. If that was the case, a series of questions were asked; to measure the prevalence and how it was managed. Table 3.5 depicts statistics of children who suffered

from Diarrhoea. The overall percentage of children who have suffered from diarrhoea in past 30 days, are slightly increased to 9 percent in 2013-14 from 8 percent in 2011-12 though it is statistically insignificant. However diarrhoea cases have increased in both Sindh urban and rural area i.e. 10

percent in 2013-14 from 8 percent in 2011-12 for urban areas and 12 percent in 2013-14 from

**Health**

9 percent in 2011-12 for rural areas. Duration of Diarrhoea shows that almost 80 percent suffered for the period of 1 to 7 days Table 3.6. There is no consistent relationship between quintiles and the incidence of childhood diarrhoea Table 3.8.

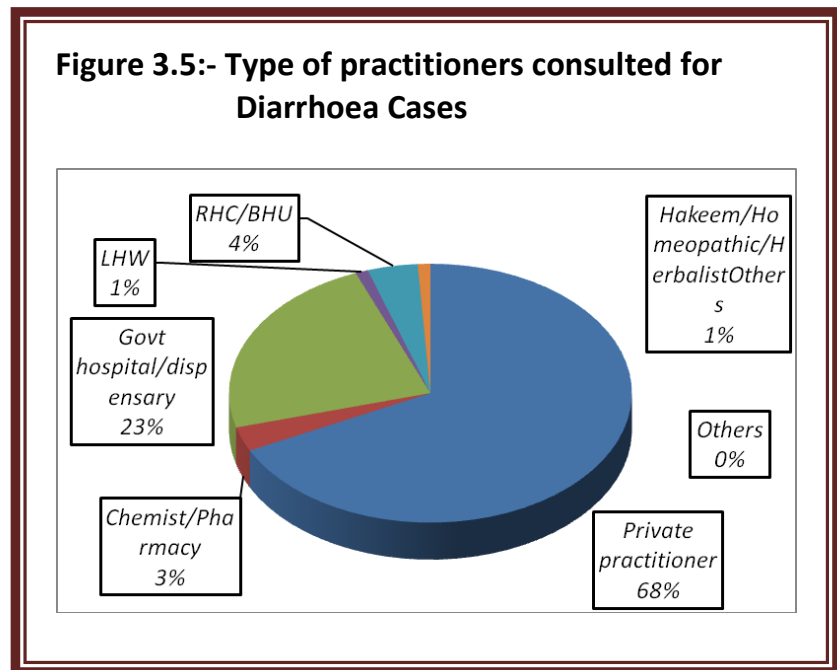

The percentage of diarrhoea cases where a practitioner of some kind was consulted shows a slight decline to 90 percent in 2013-14 from 93 percent in 2011-12 Table 3.9a. This decrease is significant in Sindh rural with 87 percent in 2013-14 as compared to 95 percent in 2011-12. In 72 percent of the diarrhoea cases, ORS was given to children Table 3.9b. A significant decrease is recorded in Punjab province where it has decline to 64 percent in 2013-14 as compared to 70 percent in 2011-12. The decrease is more significant in rural Punjab i.e. 63 percent in 2013-14 from 71 percent in 2011-12.

**Figure3.4:- Percentage of cases where a Practitioner was consulted for Diarrhea.**

**Health**

Private consultation for treatment of diarrhoea has shown increase to 67 percent in 2013-14 from 64 percent in 2011-12. On the other hand the consultation at government facilities had shown slight improvement i.e. 23 percent in 2013-14 as compared to 22 percent in 2011-12 Table 3.10. Basic health units (BHU) and rural health centres (RHC) facilities for consultation remain stagnant at 6 percent of

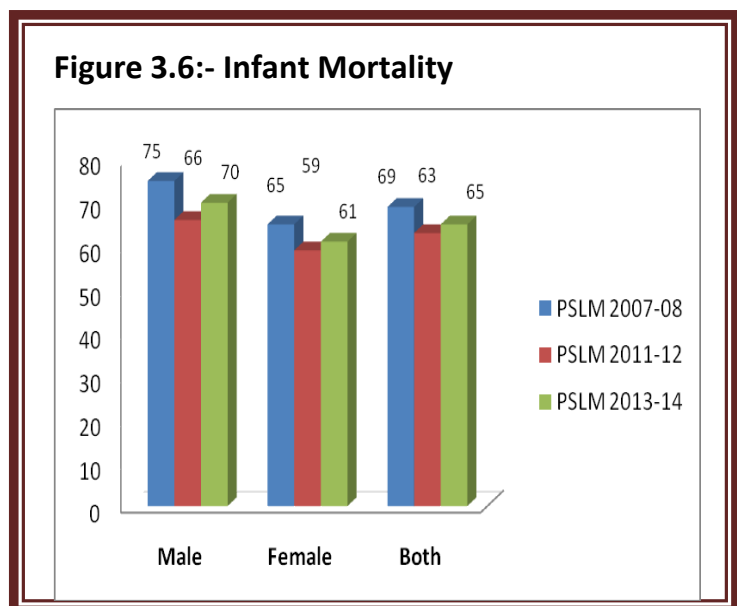

cases in rural areas, which gives some indication of the very limited use of the government primary health network for these kinds of curative services. Table 3.11 shows the percentage of cases where only government health facility is consulted first, rural Balochistan has the highest percentage with 72 percent and rural Punjab has the lowest percentage 25 percent.

The most cited reason for not availing the government facility was recorded as “Too far away” 31 percent followed by “No government facility” with 14 percent Table 3.12. However its main reason cited in urban and rural areas remain “Too far away”.

**3.4 Infant Mortality**

An increase has been observed in Infant Mortality Rate (IMR) to 65 per 1000 live births in 2013-14 from 63 per 1000 live births in 2011-12 by taking average of three

**Health**

---

years prior to survey i.e. 2009-12 Table 3.14. The infant mortality rate for rural areas has increased to 74 per 1000 live births in 2013-14 as compared to 70 per 1000 live births in 2011-12 whereas no change is observed in urban areas. The association between infant mortality and mother's education is presented in Table 3.15. As expected, low infant mortality 32 per 1000 live births is observed in children of qualified mothers (class 10 and above) and high infant mortality 75 per 1000 live births where mothers have no education.

**3.5 Pre-and Post-Natal Care**

Maternal health is the serious issue in developing countries including Pakistan. The maternal mortality can be prevented by discovering and managing potential complications. In addition to reduce the maternal mortality, the provision of quality prenatal care can also reduce the risk factors including pre-eclampsia, anaemia, and sexually transmitted diseases. Pre-natal care also encourages women to learn the perilous symptoms of pregnancy and delivery, to be immunised against tetanus and to know about infant care.

Special attention is given to improve maternal health; a huge number of Lady Health Workers are employed in this regard. These workers visit from home to home in order to create awareness about pre & post-natal care. Further a large network of health houses is also established both in urban and rural areas, where a well-trained lady health worker is available to facilitate the women about the mother and child health care before and after the delivery of child.

Table 3.16 presents the percentage of women who consulted during their last pregnancy. In this table the women who have given a birth in last 3 years prior to the survey, are taken into consideration. The significant increase noticed as 72 percent of mothers in 2013-14 as compared to 68 percent in 2011-12 who have given a birth in last 3 years prior to the survey consulted for pre-natal care during their last pregnancy.

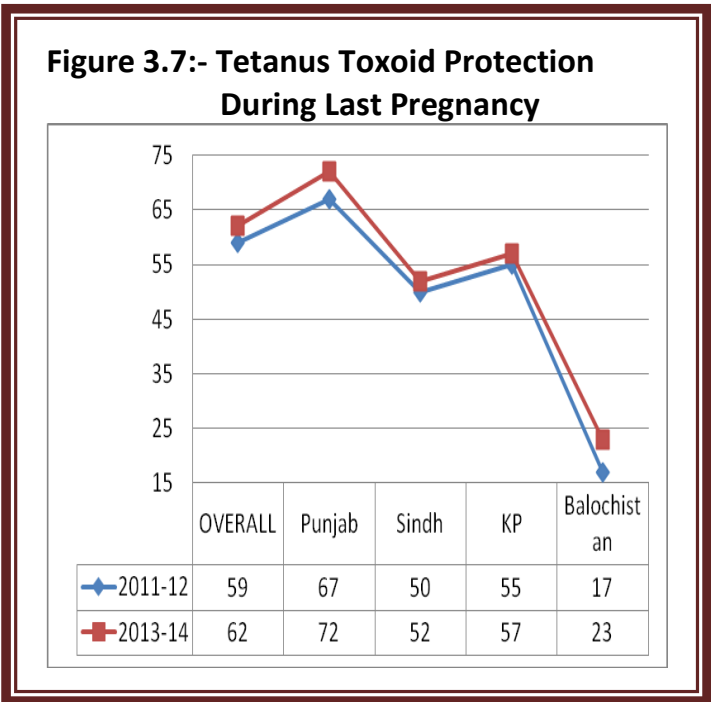

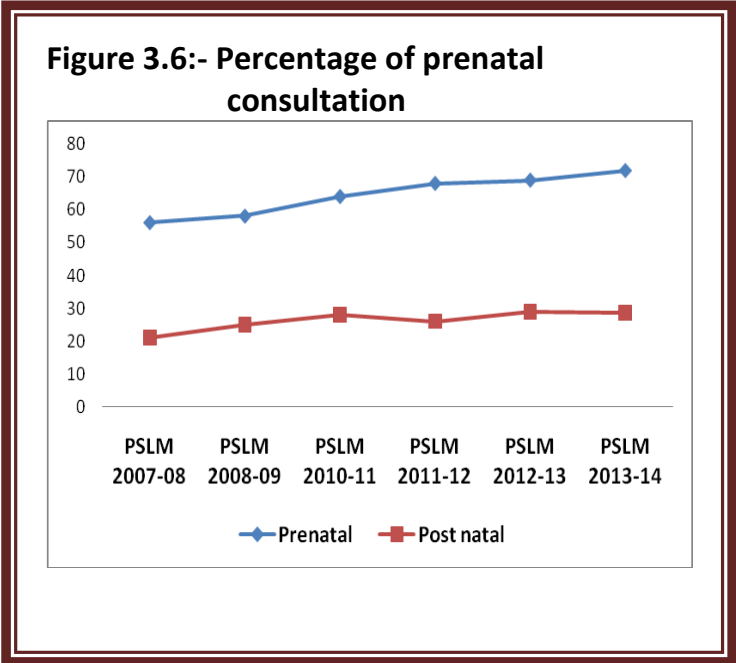

The pre natal consultation rate is much higher in urban areas 85 percent than in rural areas 66 percent. However when consider rural areas the consultation rates have increased to 66 percent in 2013-14 from 62 percent in 2011-12. Among provinces, Sindh with 76 percent have recorded the highest pre-natal consultation whereas Balochistan with 52 percent is at the

**Health**

lowest. Private clinic/ hospital with 62 percent followed by government hospital with 28 percent are the top most facilities that are visited for pre-natal consultations.

The neonatal tetanus is one of the major causes of infant’s fatality. Tetanus is mainly caused by unhygienic sanitary conditions during childbirth. In order to protect the newly born infants from tetanus, the tetanus toxoid injections are given to mothers during pregnancy. In addition to these injections which protect women from developing tetanus themselves or suffering from sepsis. Two doses of tetanus toxoid during pregnancy offer full protection. Five doses are thought to provide lifetime protection. However, a woman fully protected during a previous pregnancy and still experiences a pregnancy after ten years of full protection, is

advised to have a single booster dose. Mothers who have reported to receive a tetanus toxoid injection during their last pregnancy remained stagnant during the survey period 2011-12 to 2013-14 at 75 percent Table 3.18.

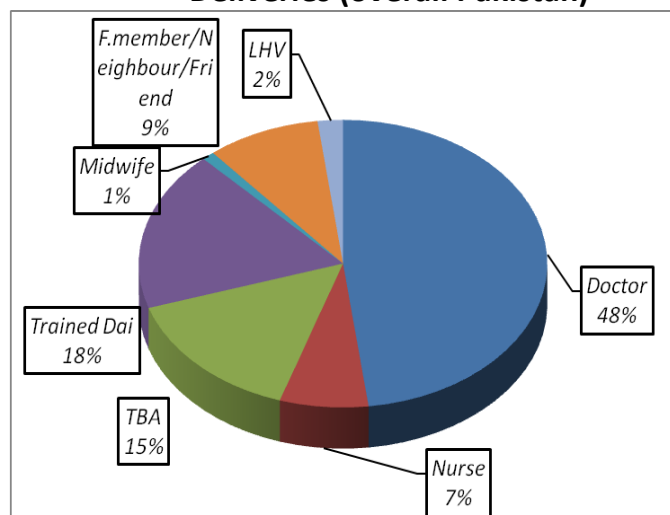

**Health**

Overall 43 percent of births in 2013-14 took place at home as compared to 50 percent in 2011-12 Table 3.18. The proportion is much higher in rural areas 52 percent as compared to urban areas 24 percent. Significant decline is observed in home delivery in both urban and rural areas. In urban areas it has decline to 24 percent in 2013-14 from 27 percent in rural areas from 2011-12 and 52 percent in 2013-14 to 60 percent in 2011-12. The most frequent location where the births occurred is Private hospitals with 37 percent, followed by government hospitals with 19 percent. However 48 percent of births are attended by doctors, followed by 18 percent by trained Dai.

**Figure 3.8:- Type of Assistance in child Deliveries (overall Pakistan)**

**Figure 3.9:- Type of Assistance in child Deliveries (Rural Pakistan)**

Overall 29 percent of mothers reported to have post-natal check-up within six weeks after delivery as compared to 26 percent in 2011-12 Table 3.19. The proportion is higher in urban areas 37 percent as compared to rural areas 25 percent. Private hospital/clinic with 50 percent and government hospital/BHU/RHC with 32 percent are the top most facilities visited for post natal consultation. The same pattern for consultation is observed both in urban and rural areas.

**Health**

---

Breast feeding is highly recommended as most secure source of food for infants. Overall 96 percent of mother reported breast feeding to their infants both in urban and rural Pakistan Table 3.20. By the age of 6 months, some 87 percent of mothers began to feed their infants with semi-solid foods.

**NOTES:**

1. Based on recall: Children reported as having received at least one immunization expressed as a percentage of all children aged 12-23 months.
2. Based on record: Children who reported having received full immunization who also have an immunization card, expressed as a percentage of all children aged 12-23 months.
3. Immunizations: To be classified as fully immunized a child must have received: 'BCG', 'DPT1', 'DPT2', 'DPT3', 'Polio1', 'Polio2', 'Polio3', 'Measles', 'H.B1', 'H.B2' and 'H.B3'. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

NOTES:

1. Diarrhoea cases where a practitioner was consulted expressed as a percentage of all diarrhoea cases during past 30 days in children less than 5 years.
2. Cases where a practitioner was consulted: For all the children that reported an episode of diarrhoea in the past 30 days the mothers were asked if they consulted a practitioner for the ailment. The statistics reported here represent the percentage of cases where a practitioner was consulted.
3. Cases where ORS was administered: For all children that reported an episode of diarrhoea in the past 30 days, the mothers were asked if ORS had been given to the child. The statistics reported here represent the percentage of cases where ORS was given to the child.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

## 4. POPULATION WELFARE

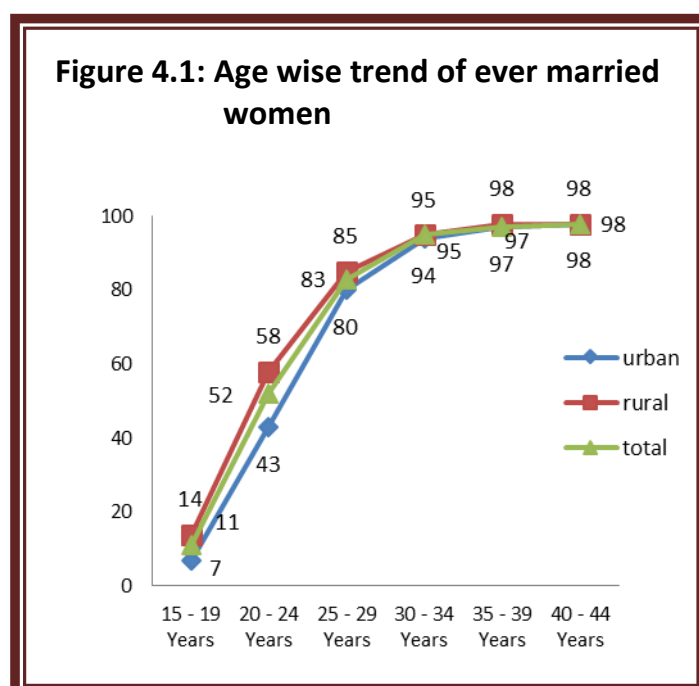

### 4.1 Introduction

To attain a balance between resources and population, the efforts are being made to promote family planning as an entitlement based on informed and voluntary choice by motivating couples to adopt family planning methods through improved access to quality reproductive health services. High levels of fertility are associated with health risks for both mother and child, Pakistan’s high population growth rate puts added pressure on efforts to expand and improve the delivery of basic social services. The Population Policy ultimately targets to pave way for benefits of demographic dividend to be realized for Pakistan. Family planning is seen as an important part of the essential package of services that is needed to contribute to the attainment of Millennium Development Goal of reducing maternal mortality by two-thirds by 2015<sup>5</sup>.

Moreover, there is a close relationship between the TFR and CPR. If the CPR rises the TFR will fall. This decline in the TFR could be more considerable if there was greater use of family planning methods in the country. This chapter presents information on key indicators in the population welfare sector, which include: marriage, parity & fertility, the awareness & use of family planning methods by its source.

### 4.2 Marriage, Parity & Fertility

The Marriage pattern of ever married women of overall Pakistan remained stagnant during 2007-08 to 2011-12 i.e. 65 percent, however, it shows marginal increase 66 percent in 2013-14. Table 4.1

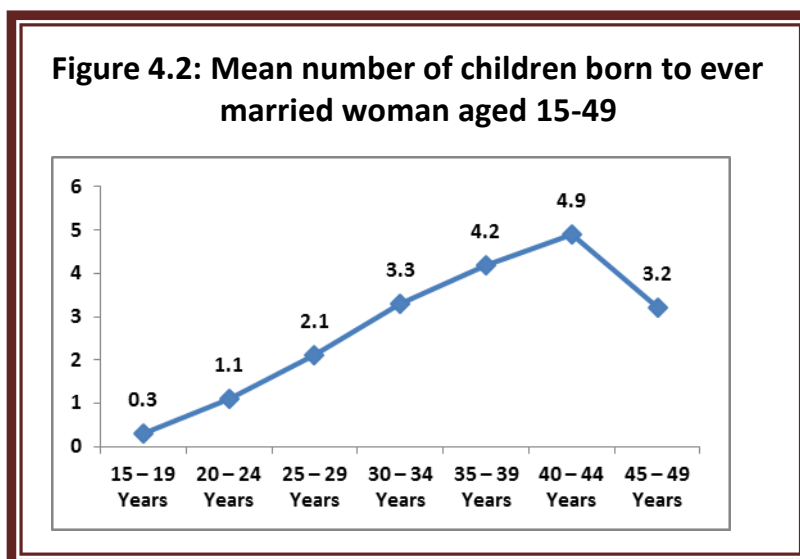

<sup>5</sup> National Population Policy – 2010

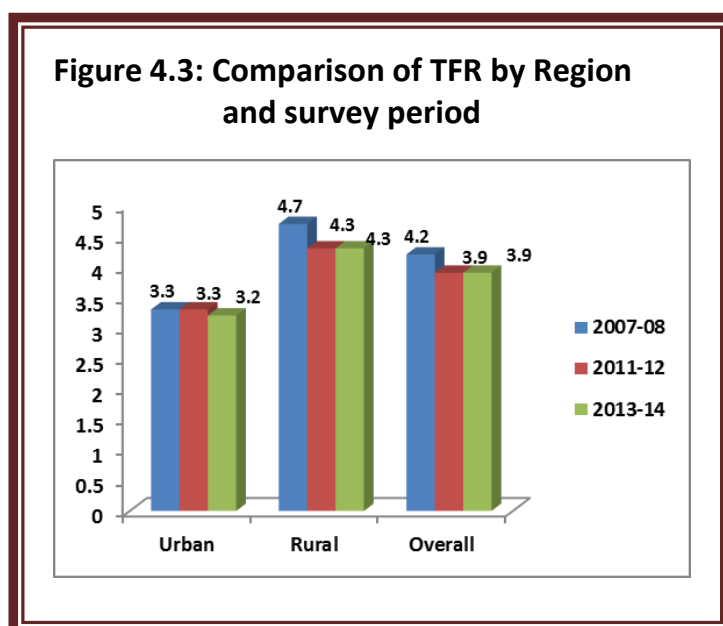

Population Welfare

There seems no change in the proportion of women ever married in the 1<sup>st</sup> age cohort (15-19) whereas an increase is observed in the 2<sup>nd</sup> cohort (20-24) i.e. 52 percent in 2013-14 as compared to 49 percent in 2011-12. The remaining age groups shows a slight increase except the age group (40-44) that stood stagnant at 98 percent and no significant change is observed in the last age group (45-49) 98 percent in 2013-14 compare to 99 percent in 2011-12.

Mean number of children ever born to ever married women of overall Pakistan has shown slight decline in year 2013-14 to 3.2 as compared to 3.3 in year 2011-12. Table 4.3

The total fertility rate (TFR) is a common measure of current fertility and is defined as the average number of children a women would have if she went through her entire reproductive period 15-49 years reproducing at the prevailing Age Specific Fertility Rate. TFR has been calculated considering an average of the three years preceding the survey. TFR, when calculated for average of three year (2010-12) shows the same trend when it is calculated for the survey year 2011-12 by taking an average of three years from 2008-10, however same trend is observed in ASFRs. Urban TFR slightly declined to 3.2 in 2013-14 as compared to 3.3 in 2011-12, but rural TFR remains stagnant at

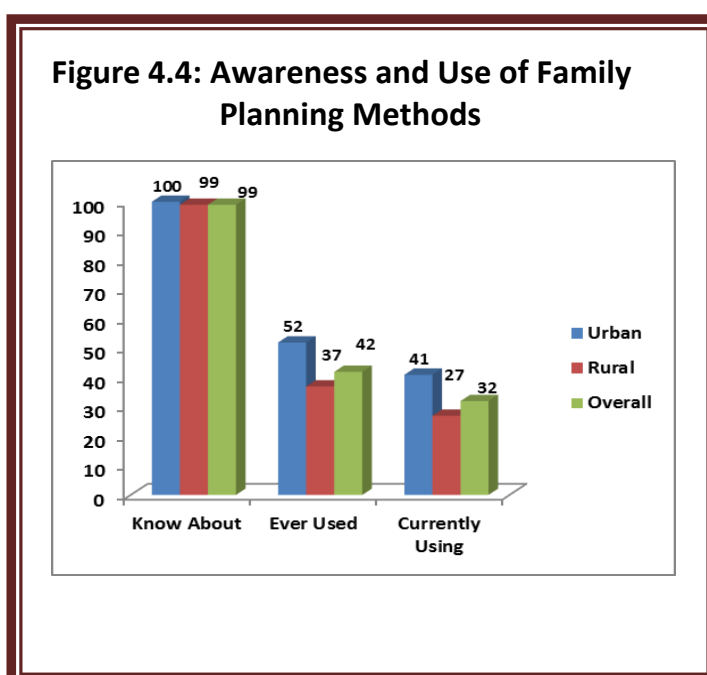

Population Welfare

4.3 percent, however it is much lower 4.7 percent when compared to figure of 2007-08 PSLM survey. Table 4.4

4.3 Awareness and Use of Family Planning

The adequate knowledge about the family planning and the use of contraception leads the couples to reduce their family size. The survey tries to cover the knowledge and the use of contraceptive methods.

Table 4.5 discusses the women knowledge, ever use and current use of contraceptive methods. 99 percent currently married women aged between 15 to 49 years have knowledge about at least one method of contraception. The percentage of women having knowledge of any method of contraception is universal in urban areas while in rural areas it is also 99 percent. Further the percentage of women which have ever used any contraceptive method has shown

increasing trend from 42 percent in 2013-14 as compared to 37 percent during 2011-12. However there is a wider gap between the regions in ever use of any contraceptive method from 52 percent in urban as compared 37 percent in rural areas. Table 4.5

In overall Pakistan the contraceptive prevalence rate (CPR) has increased to 32 percent in 2013-14 from 29 percent in 2011-12. CPR in rural areas has increased to 27 percent in 2013-14 from 25 percent in 2011-12 and similar trend is observed in urban areas where it has significantly increased to 41 percent in 2013-14 from 36 percent in 2011-12. Contraceptive use among currently married women is highest in Punjab 38 percent followed by Khyber Pakhtunkhwa 28 percent, Sindh 25 percent whereas lowest in Balochistan 13 percent. Table 4.5

Figure 4.5: Age wise use of CPR

In order to reduce the maternal mortality, family planning needed for longer birth intervals and fewer births to older and very young mothers which are key factors of maternal mortality. Family planning use is significantly lower in age groups 15-19, 20-24 and 25-29 because women of these age groups are newlywed and they are more likely and willing to become pregnant as soon as possible, hence they may not be inclined to use contraceptives. Use of family planning methods rises with age, as the older women are more likely to use family planning method as they have reached their desired family size.

Some 45 percent of the currently married women in the age group 40-44 years and 41 percent in the age group 45-49 are using family planning method as compared to only 4 percent of the age group 15-19 years. The use of contraceptive methods drops for women in late forties, as women perceive that risk of pregnancy decline as they have approached menopause. Table 4.7

Use of family planning methods changes with education, women with no education are less likely to use the family planning methods. Almost 27 percent currently married women with no education have reported to use family planning methods as compared to 40 percent currently married women with education up to class 8 & above. Table 4.7

The use of family planning methods increases with the increase in the number of children. As it is evident from table 4.7, only one percent of currently married women with no child have reported to use any method. On the other hand overall 44 percent of currently married women having 5 or more children are using contraception.

The most cited reason by currently married women that why they are not using contraception i.e. “Wanted Children” 33 percent. The second cited reasons, is “Others” 19 percent followed by “Pregnant” 15 percent. The trend is almost same in urban as well as in rural areas. Table 4.8

Table 4.9 depicts the commonly known methods of family planning. “Pills” with 99 percent is the most commonly known method followed by “Injection” with 98 percent and “Tubal Ligation” and “Condom” with 96 percent each. The least known method is “Implant” with 37 percent. This pattern is almost same in all provinces.

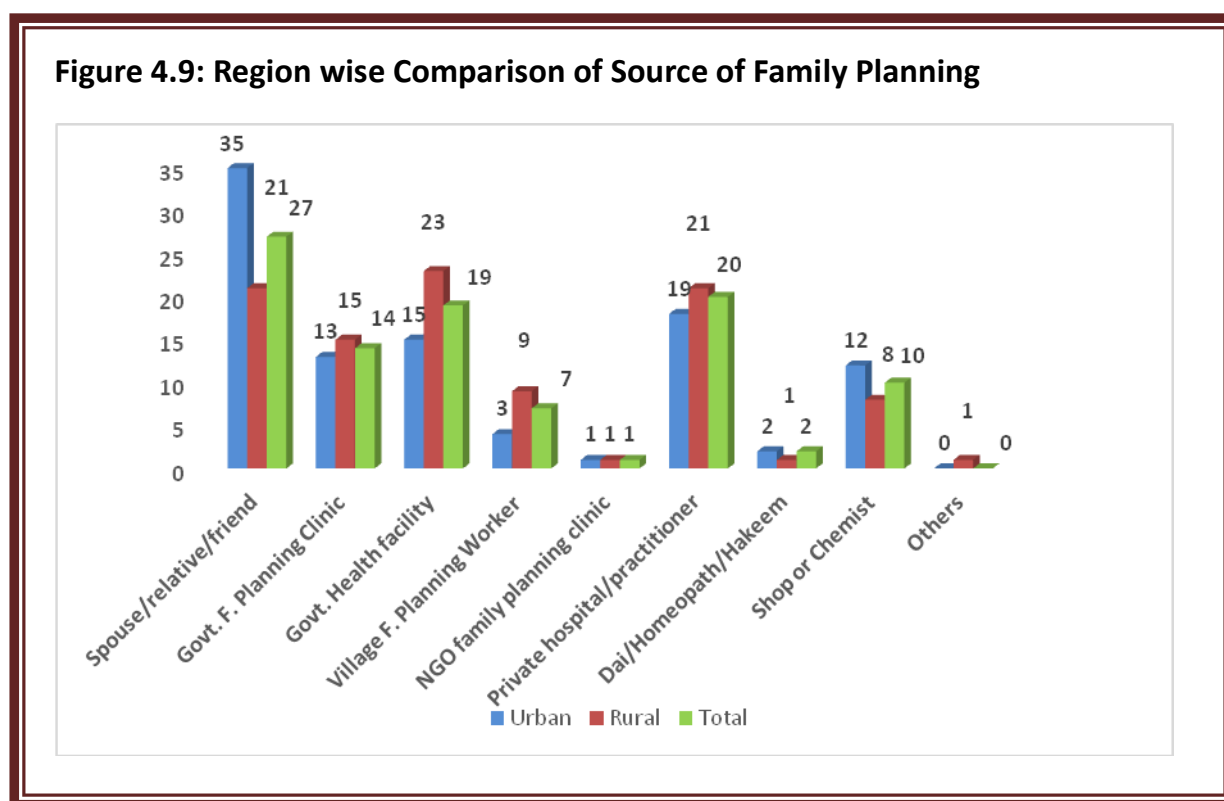

#### 4.4 Methods of Family Planning and its Source

Women who reported to have a knowledge about a specific method of family planning were inquired whether they used that method in order to delay or avoid getting pregnant. In overall Pakistan the most common method currently being used is “Withdrawal” and “Condom” with 25 Percent each followed by “Tubal Ligation” with 22 percent. In rural Pakistan, the main methods currently being used are “Tubal Ligation” and “Withdrawal” 24 percent each followed by “Condom” 21 percent whereas in urban Pakistan “Condom” with 30 percent stands the main method for avoiding pregnancy. However, there is significant difference in pattern of methods currently being used among provinces. It is observed that methods like withdrawal and tubal ligation followed by condom are prevailing in all provinces except Balochistan and Khyber Pakhtunkhwa. In Khyber Pakhtunkhwa the most common method currently being used is “Withdrawal” with 26 percent followed by “Condom” with 25 percent and “Injection” with 24 percent respectively. Whereas in

Population Welfare

Balochistan the most common method is Condom with 26 percent followed by Pills with 23 percent. Table 4.10

The Spouse/ Relatives/ Friend are the major source of provision of contraceptives with 27 percent followed by Private hospitals with 20 percent, Government health facility with 19 percent and Government family planning hospitals with 14 percent, while in urban areas major source is Spouse with 35 percent and in rural areas is the Government health facility 23 percent. Table 4.11

All women who said that they had ever used any family planning method were asked about their satisfaction; around 96 percent of women who are using any family planning method said that they found the method satisfactory. The rate of satisfaction is comparatively lower in Punjab and Sindh with 96 percent whereas higher in Khyber Pakhtunkhwa with 99 percent. Among the women who are dissatisfied with the method used, were asked about the main reasons response reported are “Husband does not Like” with 47 percent followed by “Not Effective” with 18 percent. Table 4.12

NOTES:

1. Total number of women in the relevant age-category that have ever been married, expressed as a percentage of all women in the age-category.
2. Figures given next to “Punjab”, “Sindh”, “KP”, “Balochistan”, and “Overall Pakistan” are the percentages for all women aged 15-49 years.
3. Women married or not: This is based on the question on marital status in the household roster.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

NOTES:

1. Mean number of children ever born: This is based on all women in the relevant age-categories.
2. Figures given next to "Punjab", "Sindh", "KP", "Balochistan", and "Overall Pakistan" are the mean number of children ever born for all women aged 15-49 years.
3. Women married or not: This is based on question on marital status in the household roster.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

NOTES:

1. Total number of women in the relevant category (know about, ever used, currently using), expressed as a percentage of all currently married women aged 15-49 years.
2. Know about family planning method: Both the PSLM 2011-12 & PSLM 2013-14 asked all currently married women aged 15-49 if they knew about family planning. The table is based on the answers given to this question: i.e. if the women know of any method, mentioned either spontaneously or after probing.
3. Ever used family planning method: Expressed as a percentage of all currently married women aged 15-49 years. Currently using family planning method: Expressed as percentage of all currently married women aged 15-49 years.
4. In PSLM Survey 2011-12, 57 areas and 2013-14, 61 areas of Balochistan province could not be covered due to security reasons, so the results of Balochistan province may be read with caution.

## 5. WATER SUPPLY AND SANITATION

### 5.1 Introduction

In Pakistan most of the households do not have access to adequate potable or shallow water. Similarly sanitation is one of the basic necessities, which contributes to human dignity and quality of life and is an essential pre-requisite for success. The Government of Pakistan, while recognizing that access to safe drinking water is the basic human right for every citizen and that is the responsibility of the state to ensure its provision to all citizen, Government is committed to provide adequate quantity of safe drinking water to the entire population at an affordable cost and in an equitable, efficient and sustainable manner.

In order to fulfill this commitment of the Government, the Ministry of Environment, in line with provisions of the National Environment Policy has formulated the National Drinking Water Policy 2009 through a countrywide consultation process with the aim to increase public awareness about water safety, safe hygiene practices and water conservation<sup>6</sup>.

### 5.2 Sources of Drinking Water

In PSLM Survey, questions are asked to know the main source of drinking water. Therefore this information is collected on tap water, motorized pumping, hand pump, dug well and other sources under the category of “others” which includes sea\river\pond\stream\canal, tanker, mineral water and filtration plant. Tap water is a delivery system where the water is delivered through a network of pipes and the water is treated before it is supplied. In urban areas generally, water comes in to house through pipes and is stored in tanks built in the house, then the water for the use of household is lifted to small tanks built at the top of the house, such system should be recorded as tap water supply. Hand Pump is a pump operated manually to draw water from a bored hole. Dug well is of two types, opened or closed well.

Drinking or potable water is considered as safe water safe assumed that it has low risk of immediate or long term harm for humans

<sup>6</sup> National Drinking Water Policy 2009, Ministry of Environment, Government of Pakistan

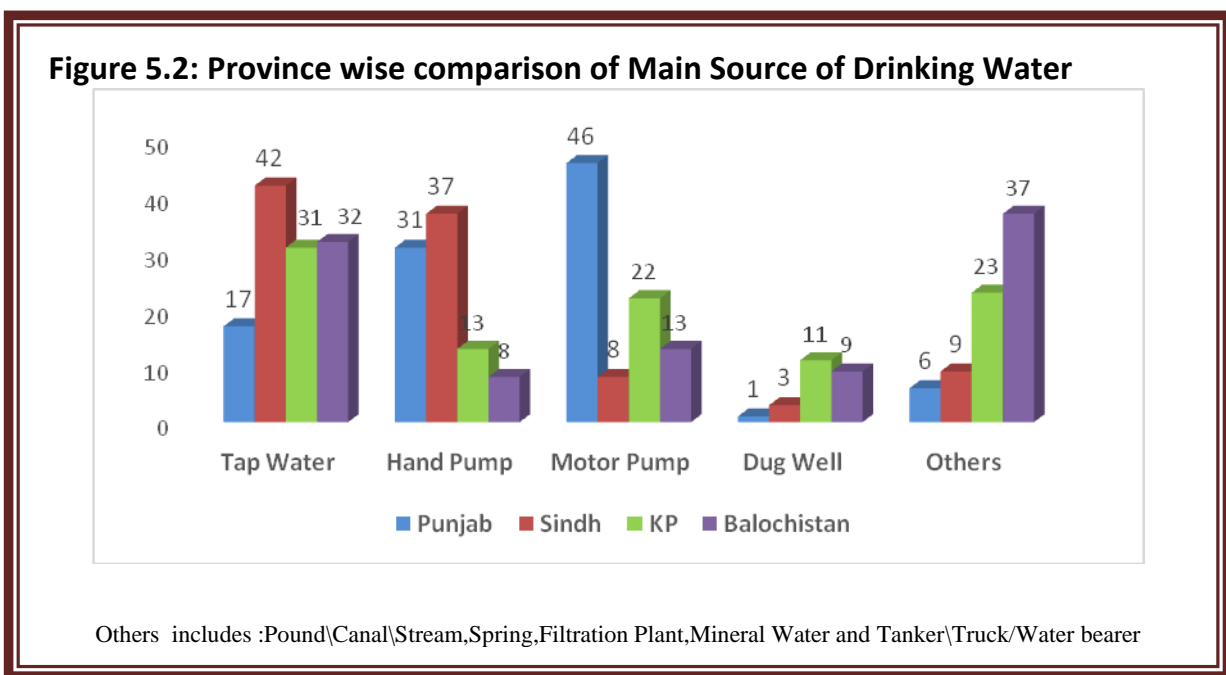

Water Supply & Sanitation

In overall Pakistan 32 percent of households are using motorized pumping as main source of drinking water in 2013-14 as compared to 30 percent in 2011-12 followed by hand pump with 29 percent in 2013-14 as compared to 30 percent in 2011-12 and tap water with 26 percent in 2013-14 as compared to 29 percent in 2011-12.

Hand pump with 41 percent is the main source of drinking water in rural areas whereas Tap water with 52 percent is the main source of drinking water in urban areas. Table 5.1

The vast majority of the population of Punjab 77 percent has water either from hand pump or motor pump, followed by tap water with 17 percent. In Punjab the use of motor pump has been increased to 46 percent in 2013-14 from 42 percent in 2011-12. Sindh has

**Water Supply & Sanitation**

shown a slight decline in terms of hand pump 37 percent in 2013-14 as compared to 39 percent in 2011-12. In Khyber Pakhtunkhwa main source of drinking water is tap water 31 percent in 2013-14 which has significantly declined from 41 percent in 2011-12. However, decline in use of tap water in Khyber Pakhtunkhwa is compensated by increase in motorized pumping and spring with 22 percent and 16 percent in 2013-14 as compared to 18 percent and 11 percent in 2011-12. In Balochistan the main source of drinking water is tap water with 32 percent in 2013-14 as compared to 38 percent in 2011-12. Table 5.1

Richer households are substantially more likely to have tap water at household. There are variations between urban and rural areas, some 56 percent of households in the highest quintile in urban areas are using tap water as a main source of drinking water as compared to only 16 percent households in the same quintile in rural areas, whereas only 34 percent household use tap water in the lowest quintile. On the other hand, in rural areas, the use of hand pump is reported with higher percentage for lowest quintile i.e 59 percent while motor pump with 52 percent is reported as the main source of drinking water in highest quintile. Table 5.2

A small proportion of households pay for drinking water. In the population as a whole, only 21 percent of households pay for water and this proportion reaches to 8 percent only in rural areas as compared to 44 percent in urban areas. Table 5.3

In 2013-14, PSLM recorded information on installation of water delivery system used by the household where 61 percent of the household arranged their own supply of drinking water. Provincial and local government in the form of Rural Development

**Water Supply & Sanitation**

Department, the Public Health Engineering Department and other non-government bodies have installed the water supplies to some 39 percent of the households. Table 5.5

Households that depend on poorest sources (river\canal\stream\pond, Dud well) also have to travel far away for the water. In Overall Pakistan some 81 percent of households have drinking water facility inside their houses. If we compare among provinces, 87 percent households in Punjab have drinking water facility inside their home followed by Sindh with 79 percent, Khyber Pakhtunkhwa with 69 percent and Balochistan with 51 percent. Table 5.6

**5.3 Sanitation**

The term sanitation, however, extends to cover cleanliness, hygiene, proper collection of liquid and solid wastes and their environmentally sound disposal. In this endeavor, the needs for waste reduction, reuse, recycle and change in the attitude towards consumption and production patterns are other imperatives for achieving goals of sustainable environment. The main goal of National Sanitation Policy is to provide adequate coverage for improving the quality of life of the people of Pakistan and to provide physical environment necessary for healthy life<sup>7</sup>.

Sanitation is the process of maintaining cleanliness and dealing with sewage

Sanitation is also an important indicator of MDG. Toilet is a fixture for defecation and urination, consisting of a bowl fitted with a hinged seat and connected to a waste pipe and a flushing apparatus. In the questionnaire response was recorded regarding the type of toilet used by the household. A toilet, which is used by the household and is situated in the yard, is considered as a toilet in the household.

In overall Pakistan 74 percent households have flush toilet facility in

<sup>7</sup> National Sanitation policy, Government of the Islamic Republic of PPakistan, Ministry of Environment

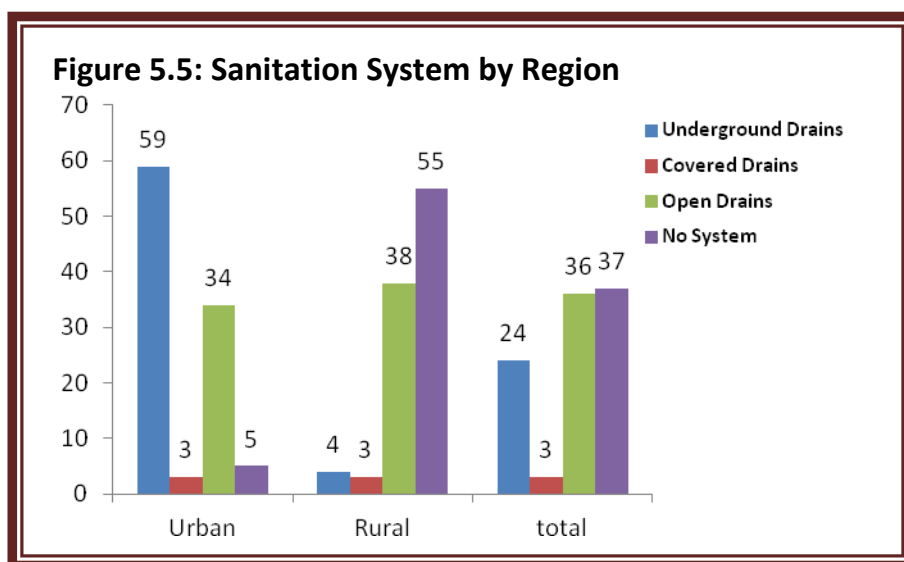

**Water Supply & Sanitation**

2013-14 as compared to 72 percent in 2011-12. Data shows that majority of urban households with 98 percent have flush facility while only 61 percent of rural households have this facility. Only 17 percent households in 2013-14 do not have any toilet facility as compared to 18 percent in 2011-12. This varies largely between urban and rural areas, 1 percent of urban households have no toilet facility as compared to 26 percent of rural households, where the Balochistan rural is the highest i.e. 35 percent without any toilet facility. Among provinces the percentage of households with no toilet facility is highest in Balochistan with 26 percent and lowest in Sindh with 12 percent, comparing among the provinces regarding flush facility Punjab is the highest with 81 percent Balochistan is lowest with 39 percent. Table 5.7

Richer households have much greater use of flush toilets facility than poor households. The use of flush toilets is universal for the richest urban households, compared to 85 percent in richest households in rural areas. Table 5.8

Sanitation is the hygienic means of promoting health through prevention of human contact with the hazards of wastes. In PSLM 2013-14 information is collected on type of sanitation system used by household. Some 37 percent of households do not have any form of sanitation system in

2013-14 as compared to 33 percent in 2011-12. Urban and rural areas have contrasting picture in this regard as 55 percent of households in rural areas do not have any sanitation system as compared

to only 5 percent of households in urban areas. Provincial comparison shows that in Balochistan highest percentage of households do not have any sanitation system 67 percent as compared to Punjab which is lowest 29 percent. Table 5.9

**Water Supply & Sanitation**

As would be expected, richer households are more likely to have a connection to a sanitation system than poor households. The relationship is much stronger in urban areas 72 percent as compared to 14 percent in rural areas. Table 5.10

In overall Pakistan 76 percent of households reported that they had no garbage collection system in 2013-14 as compared to 75 percent in 2011-12. Here again there is wider gap in households who have no garbage collection system between urban and rural areas with 43 percent and 95 percent respectively. In rural areas, the pattern is more or less same for all the four provinces but slightly better in Punjab. Table 5.11

## APPENDIX A: TECHNICAL NOTES

### TECHNICAL NOTES PART A

#### DEFINITIONS OF SOME KEY INDICATORS

##### **PRIMARY GROSS ENROLMENT RATE:-**

Number of children attending primary level (classes 1-5) divided by number of children aged 5-9 years multiplied by 100. Enrolment in Katchi is excluded.

##### **PRIMARY NET ENROLMENT RATE:-**

Number of children attending primary level (classes 1-5) aged 5-9 years divided by children aged 5-9 years multiplied by 100. Enrolment in Katchi is excluded.

##### **MIDDLE GROSS ENROLMENT RATE:-**

Number of children attending middle level (classes 6-8) divided by number of children aged 10-12 years multiplied by 100.

##### **MIDDLE NET ENROLMENT RATE:-**

Number of children aged 10-12 years attending middle level (classes 6-8) divided by number of children aged 10-12 years multiplied by 100.

##### **MATRIC GROSS ENROLMENT RATE:-**

Number of children attending matric level (classes 9-10) divided by number of children aged 13-14 years multiplied by 100.

##### **MATRIC NET ENROLMENT RATE:-**

Number of children aged 13-14 years attending matric level (classes 9-10) divided by number of children aged 13-14 years multiplied by 100.

**Technical Notes**

---

**LITERACY RATE:-**

Population aged 10 years and older that can read and write with understanding in any language expressed as percentage of total population aged 10 years and older.

**GENDER PARITY INDEX:-**

The GPI at primary or secondary is defined as net enrolment rate of females at primary or secondary level divided by net enrolment rate of males in primary or secondary level.

**YOUTH GENDER PARITY INDEX:**

Youth literacy GPI is defined as persons who are 15-24 years old and literate divided by total number of persons 15-24 years old.

**BASED ON RECALL-ATLEAST ONE IMMUNIZATION:-**

Children aged 12-23 months reported as having received at least one immunization expressed as percentage of all children aged 12-23 months.

**BASED ON RECORD –FULLY IMMUNIZED:-**

Children aged 12-23 months who reported having received full immunization who also have an immunization card, expressed as a percentage of all children aged 12-23 months. To be classified as fully immunised a child must have received: 'BCG', DPT1, DPT2, DPT3, polio1, polio2, polio3 and Measles.

**DIARRHOEA:-**

Children less than 5 years who suffered from diarrhoea in the last 30 days expressed as percentage of all children aged less than 5 years.

**PRE-NATAL:-**

Ever married women aged 15 – 49 years who had given birth in the last three years and who had attended at least one pre-natal consultation during the last pregnancy, expressed as a percentage of all ever married women aged 15 – 49 years who had given birth in the last three years.

**Technical Notes**

---

**POST-NATAL:-**

Postnatal is the period beginning immediately after the birth of a child and extending for about six weeks.

Ever married women aged 15-49 years who received post-natal check-up expressed as a percentage of all ever married women aged 15-49 years who had a birth in the last three years.

**TETANUS TOXOID INJECTIONS:-**

Currently married women aged 15-49 years who had a birth in the last three years and received a tetanus toxoid injection during the last pregnancy, expressed as a percentage of all currently married women aged 15-49 years who had a birth in the last three years.

**INFANT MORTALITY RATE:-**

Infant mortality rates are calculated as the proportion of children who die before they reach their first birthday.

**TOTAL FERTILITY RATES:-**

TFR is an average number of children which a cohort of 1000 women aged (15-49) will bear during their reproductive span if they experience no mortality and are exposed to the age specific birth rate. TFR has been calculated considering an average of the three years preceding the survey.

**CONTRACEPTIVE PREVALENCE RATE:-**

Percentage of currently married women who are currently using family planning methods expressed as percentage of all currently married women aged 15-49 years.

**TECHNICAL NOTES PART B:**

**ESTIMATION PROCEDURE ADOPTED FOR PSLM SURVEY**

**NOTATIONS:**

$N_h$  = Total number of Primary Sampling Units (PSUs) in the  $h$ th stratum of a province.

$n_h$  = Total number of sample PSUs in the  $h$ th stratum of a province.

$M_{hi}$  = Total number of Secondary Sampling Units (SSUs) in the  $i$ th sample PSU of  $h$ th stratum of a province.

$m_{hi}$  = Number of sample SSUs in the  $i$ th sample PSU of  $h$ th stratum of a province.

$P_{hi}$  = Assigned probability of selection of  $i$ th PSU of the  $h$ th stratum of a province.

$y_{hij}$  = Value of any characteristic  $y$  of  $j$ th SSU within  $i$ th PSU of  $h$ th stratum of a province.

$x_{hij}$  = Value of any characteristic  $x$  of  $j$ th SSU within  $i$ th PSU of  $h$ th stratum of a province with whose respect proportion is required.

**(i): ESTIMATION FORMULAE FOR TOTALS AND THEIR VARIANCES**

$$N = \sum_{h=1}^L N_h$$

$$n = \sum_{h=1}^L n_h$$

$$\hat{Y}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{\hat{Y}_{hi}}{P_{hi}}$$

OR

$$\hat{Y}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{1}{P_{hi}} \frac{M_{hi}}{m_{hi}} \sum_{j=1}^{m_{hi}} y_{hij}$$

$$\hat{Y} = \sum_{h=1}^L \hat{Y}_h = \sum_{h=1}^L \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{\hat{Y}_{hi}}{P_{hi}}$$

For  $X$ , another variable of interest, we have

Technical Notes

$$\hat{X}_h = \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{\hat{X}_{hi}}{P_{hi}} = \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{1}{P_{hi}} \frac{M_{hi}}{m_{hi}} \sum_{j=1}^{m_{hi}} x_{hij}$$

$$\hat{X} = \sum_{h=1}^L \hat{X}_h = \sum_{h=1}^L \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{\hat{X}_{hi}}{P_{hi}}$$

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

$$v(\hat{y}_h) = \frac{1}{n_h} s^2_{ht} = \frac{1}{n_h(n_h - 1)} \left( \sum_{i=1}^{n_h} \frac{\hat{Y}^2_{hi}}{P^2_{hi}} - \frac{\left( \sum_{i=1}^{n_h} \frac{\hat{y}_{hi}}{P_{hi}} \right)^2}{n_h} \right)$$

$$v(\hat{Y}) = \sum_{h=1}^L \frac{1}{n_h} s^2_{ht} = \sum_{h=1}^L \frac{1}{n_h(n_h - 1)} \left( \sum_{i=1}^{n_h} \frac{\hat{Y}^2_{hi}}{P^2_{hi}} - \frac{\left( \sum_{i=1}^{n_h} \frac{\hat{y}_{hi}}{P_{hi}} \right)^2}{n_h} \right)$$

(ii): FORMULA FOR RATIO ESTIMATES

$$r = \frac{\hat{Y}}{\hat{X}}$$

where  $\hat{Y}$  and  $\hat{X}$  can be estimated by equations under item (i) given above.

$$Rel V(r) = \frac{1}{\hat{X}^2} \sum_{h=1}^L \frac{1}{n_h} s^2_{hb} + \frac{1}{\hat{X}^2} \sum_{h=1}^L \frac{1}{n_h} \sum_{i=1}^{n_h} \frac{M^2_{hi}}{P^2_{hi} m_{hi}} \frac{(M_{hi} - m_{hi})}{M_{hi}} s^2_{hw}$$

where

$$s^2_{hb} = s^2_{ht} - s^2_{hw}$$

$$s^2_{ht} = s^2_{hy} + r^2 s^2_{hx} - 2r s_{hxy}$$

$$s^2_{hx} = \frac{1}{(n_h - 1)} \left[ \sum_{i=1}^{n_h} \frac{\hat{X}^2_{hi}}{P^2_{hi}} - \frac{\left( \sum_{i=1}^{n_h} \frac{\hat{x}_{hi}}{P_{hi}} \right)^2}{n_h} \right]$$

$$s^2_{hy} = \frac{1}{(n_h - 1)} \left[ \sum_{i=1}^{n_h} \frac{\hat{y}_{hi}^2}{p_{hi}^2} - \frac{\left( \sum_{i=1}^{n_h} \hat{y}_{hi} \right)^2}{n_h} \right]$$

$$s_{hxy} = \frac{1}{n_h - 1} \left[ \sum_{i=1}^{n_h} \left( \frac{\hat{x}_{hi}}{p_{hi}} \frac{\hat{y}_{hi}}{p_{hi}} \right) - \frac{\left( \sum_{i=1}^{n_h} \frac{\hat{x}_{hi}}{p_{hi}} \right) \left( \sum_{i=1}^{n_h} \frac{\hat{y}_{hi}}{p_{hi}} \right)}{n_h} \right]$$

$$s^2_{hw} = \frac{1}{n_h - 1} \sum_{i=1}^{n_h} \frac{1}{p_{hi}^2} \frac{M_{hi}^2}{m_{hi}} \frac{(M_{hi} - m_{hi})}{M_{hi}} s^2_{hi}$$

and

$$s^2_{hi} = s^2_{hiy} + r^2 s^2_{hix} - 2r s_{hixy}$$

$$s^2_{hiy} = \frac{1}{(m_{hi} - 1)} \left[ \sum_{j=1}^{m_{hi}} y_{hij}^2 - \frac{\left( \sum_{j=1}^{m_{hi}} y_{hij} \right)^2}{m_{hi}} \right]$$

$$s^2_{hix} = \frac{1}{(m_{hi} - 1)} \left[ \sum_{j=1}^{m_{hi}} x_{hij}^2 - \frac{\left( \sum_{j=1}^{m_{hi}} x_{hij} \right)^2}{m_{hi}} \right]$$

$$s^2_{hixy} = \frac{1}{(m_{hi} - 1)} \left[ \sum_{j=1}^{m_{hi}} x_{hij} y_{hij} - \frac{\left( \sum_{j=1}^{m_{hi}} x_{hij} \sum_{j=1}^{m_{hi}} y_{hij} \right)}{m_{hi}} \right]$$

**TECHNICAL NOTES PART C:****CONSUMPTION QUINTILES**

Consumption quintiles are used to distinguish the population according to their welfare: poorest households are grouped together into the 1st quintile, those with higher consumption into the 2nd quintile, and so on. Five quintiles rank the population from the poorest 20% to the richest 20%. The main aim of quintile is to analyse how social and economic indicators change in relation to people's welfare. For instance, the government wants to know whether poorer households have access to basic services (immunization, schools, safe water etc.) or whether there are significant differences between the poor and the rich. Furthermore, policy makers are interested to know how consumption patterns and income sources of poorer households are different from those of richer households. Estimates by quintiles describe distributional differences, thus representing an important tool of analysis.

Quintiles are calculated for the four provinces together (Punjab, Sindh, KP and Balochistan) so that the first quintile contains in it households from all provinces with the same welfare. However, if one province is relatively richer than others its population will not be evenly distributed in each quintile, but mostly concentrated in the higher quintiles. In fact, only at the overall level each quintile contains 20% of the population, but in urban areas, where people usually are richer, upper quintiles contain higher population percentages, and the opposite is true in rural areas.

Consumption expenditure is used as a proxy to assess people's welfare. Expenditure is calculated at the household level but it is adjusted by household size (see table 4) and its composition. This adjustment is necessary to assess a proper ranking of households. Reasons can become clear with some examples. Imagine two households both with a monthly consumption expenditure of Rs. 3000. However, it would be wrong to say that both households enjoy the same welfare without considering their household size and composition. For instance, one household may be composed of one single individual whereas the other of five people.
